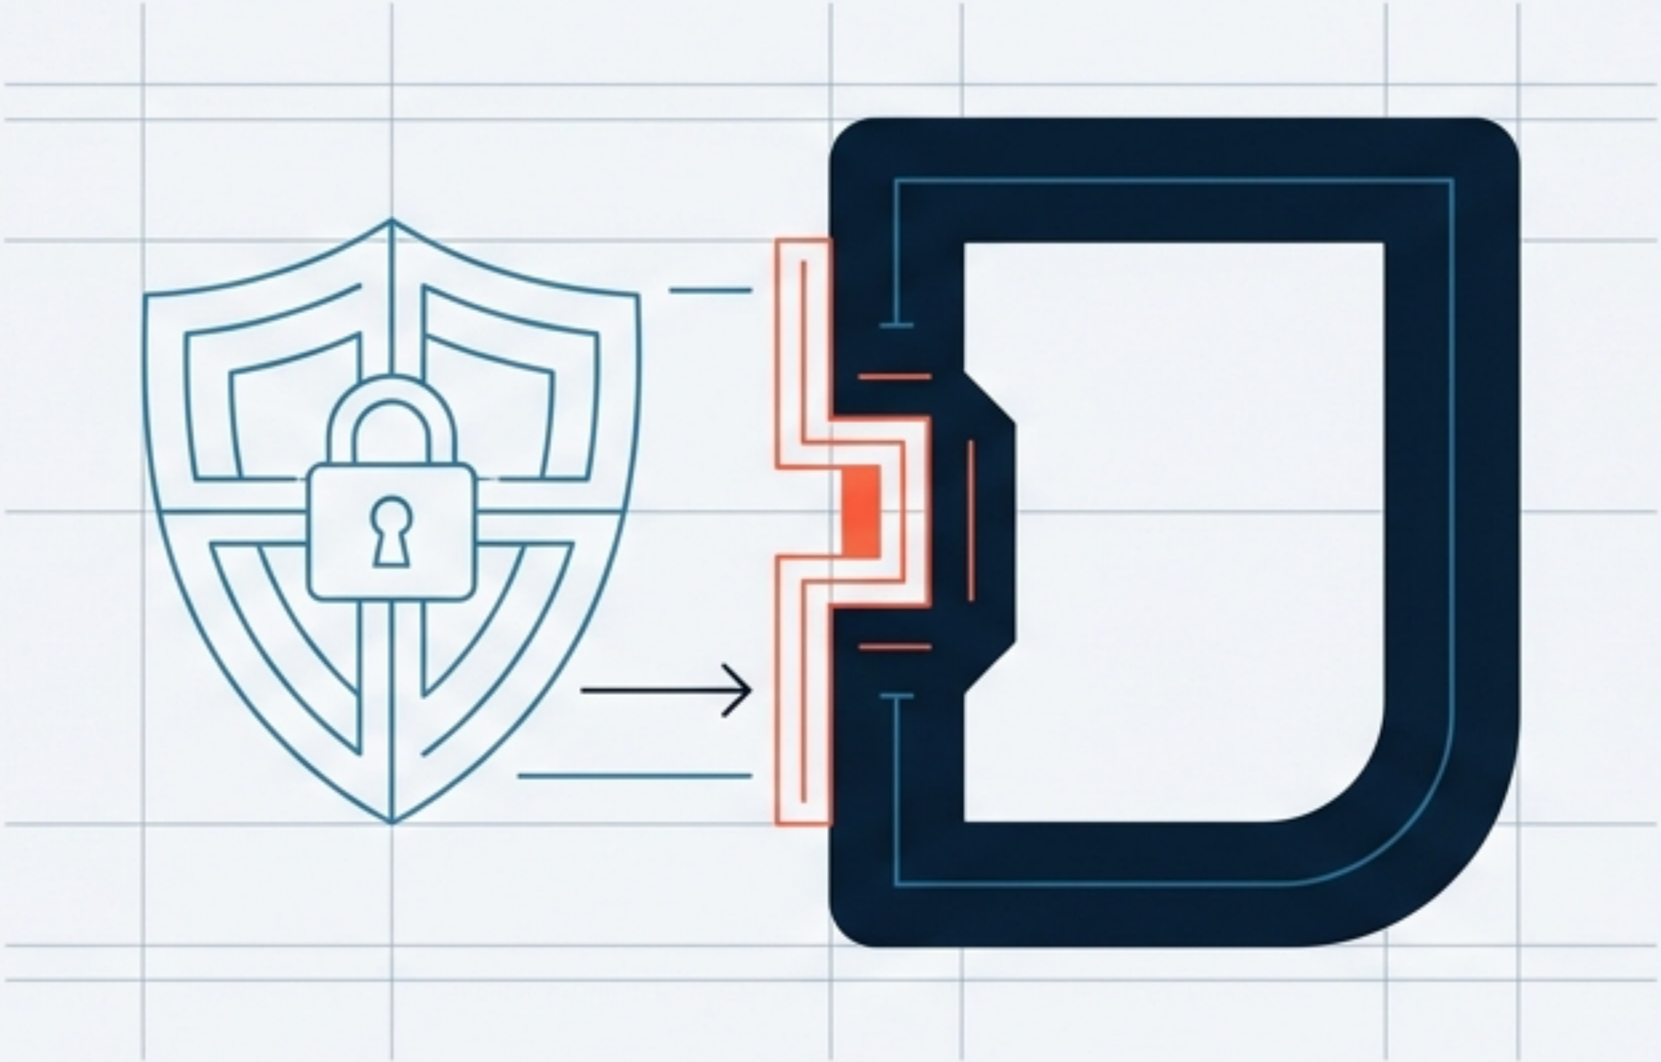
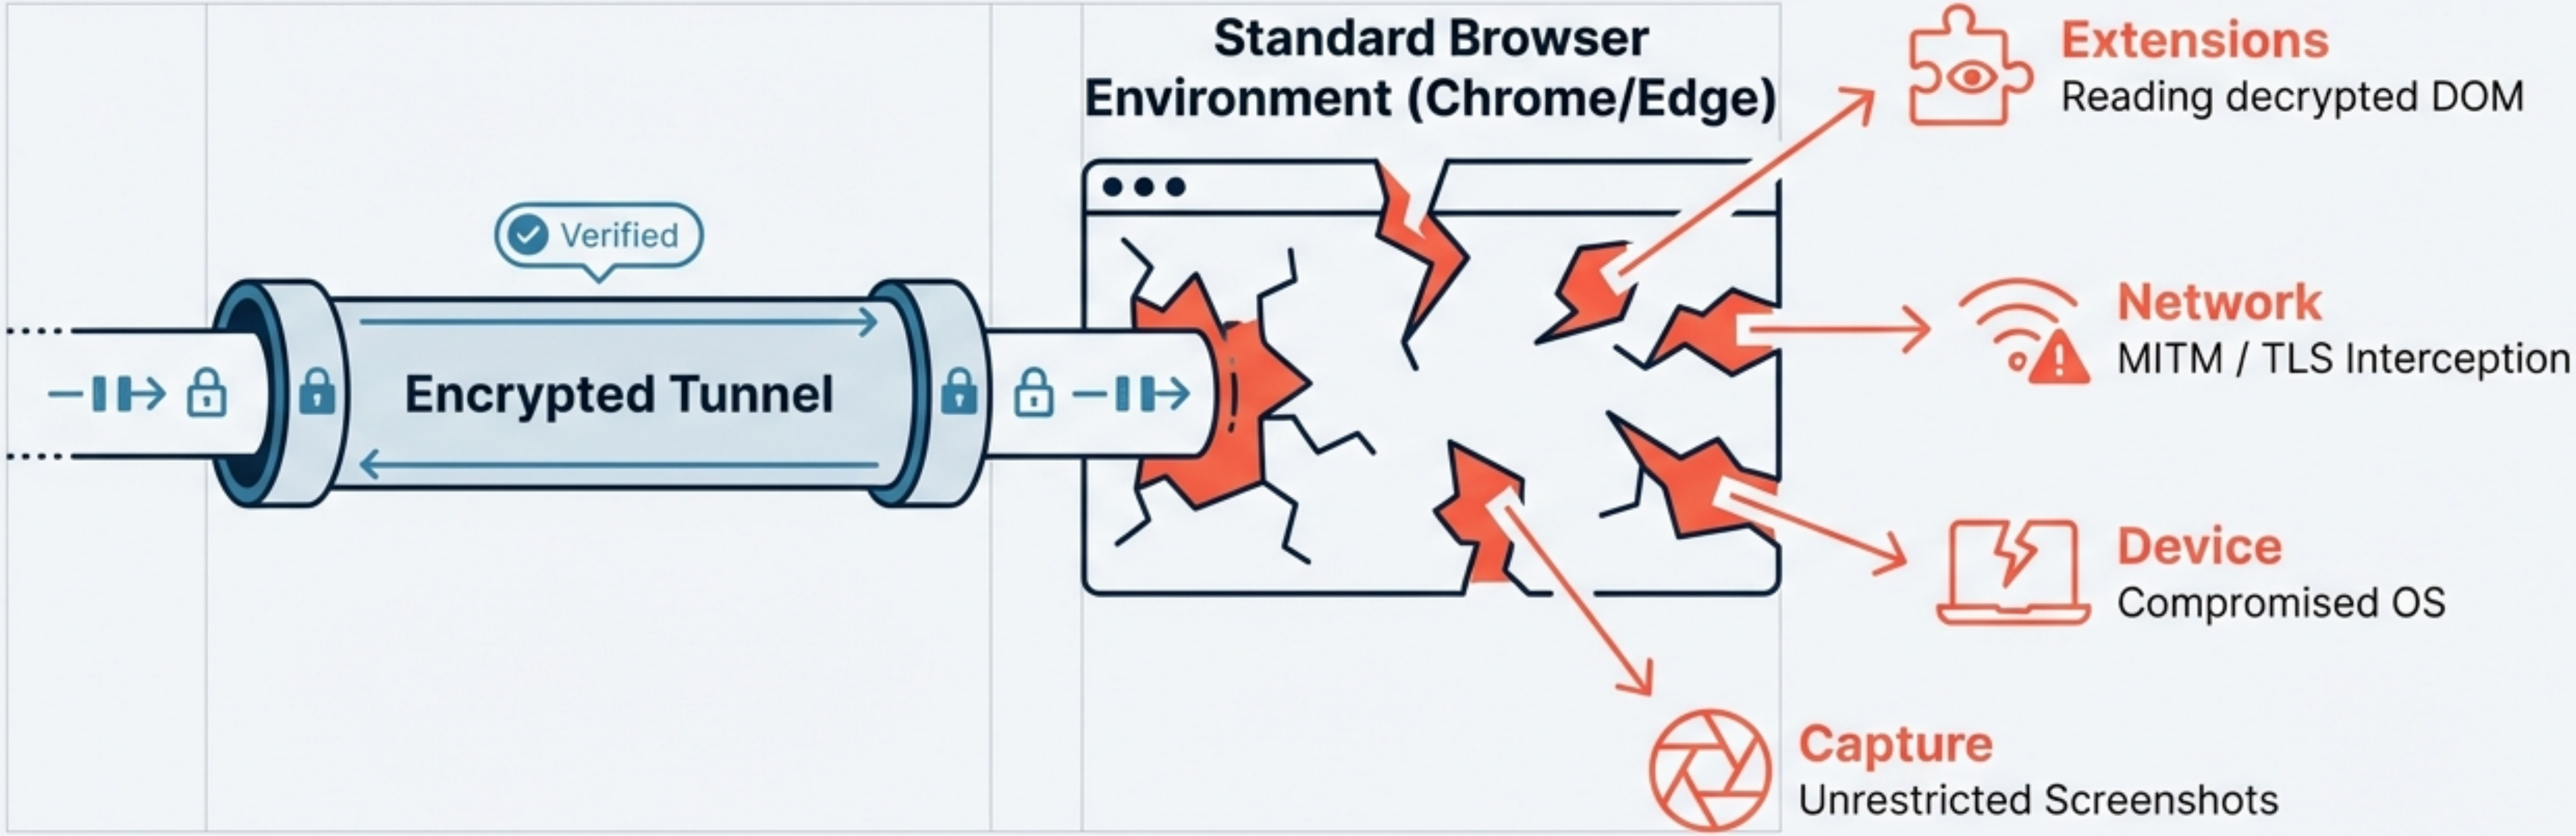
# SG/Send + Surf Security: The Integration Concept

Leveraging the Managed Browser to Guarantee Zero-Knowledge Security.



# The "Last Mile" Security Gap in Standard Browsers



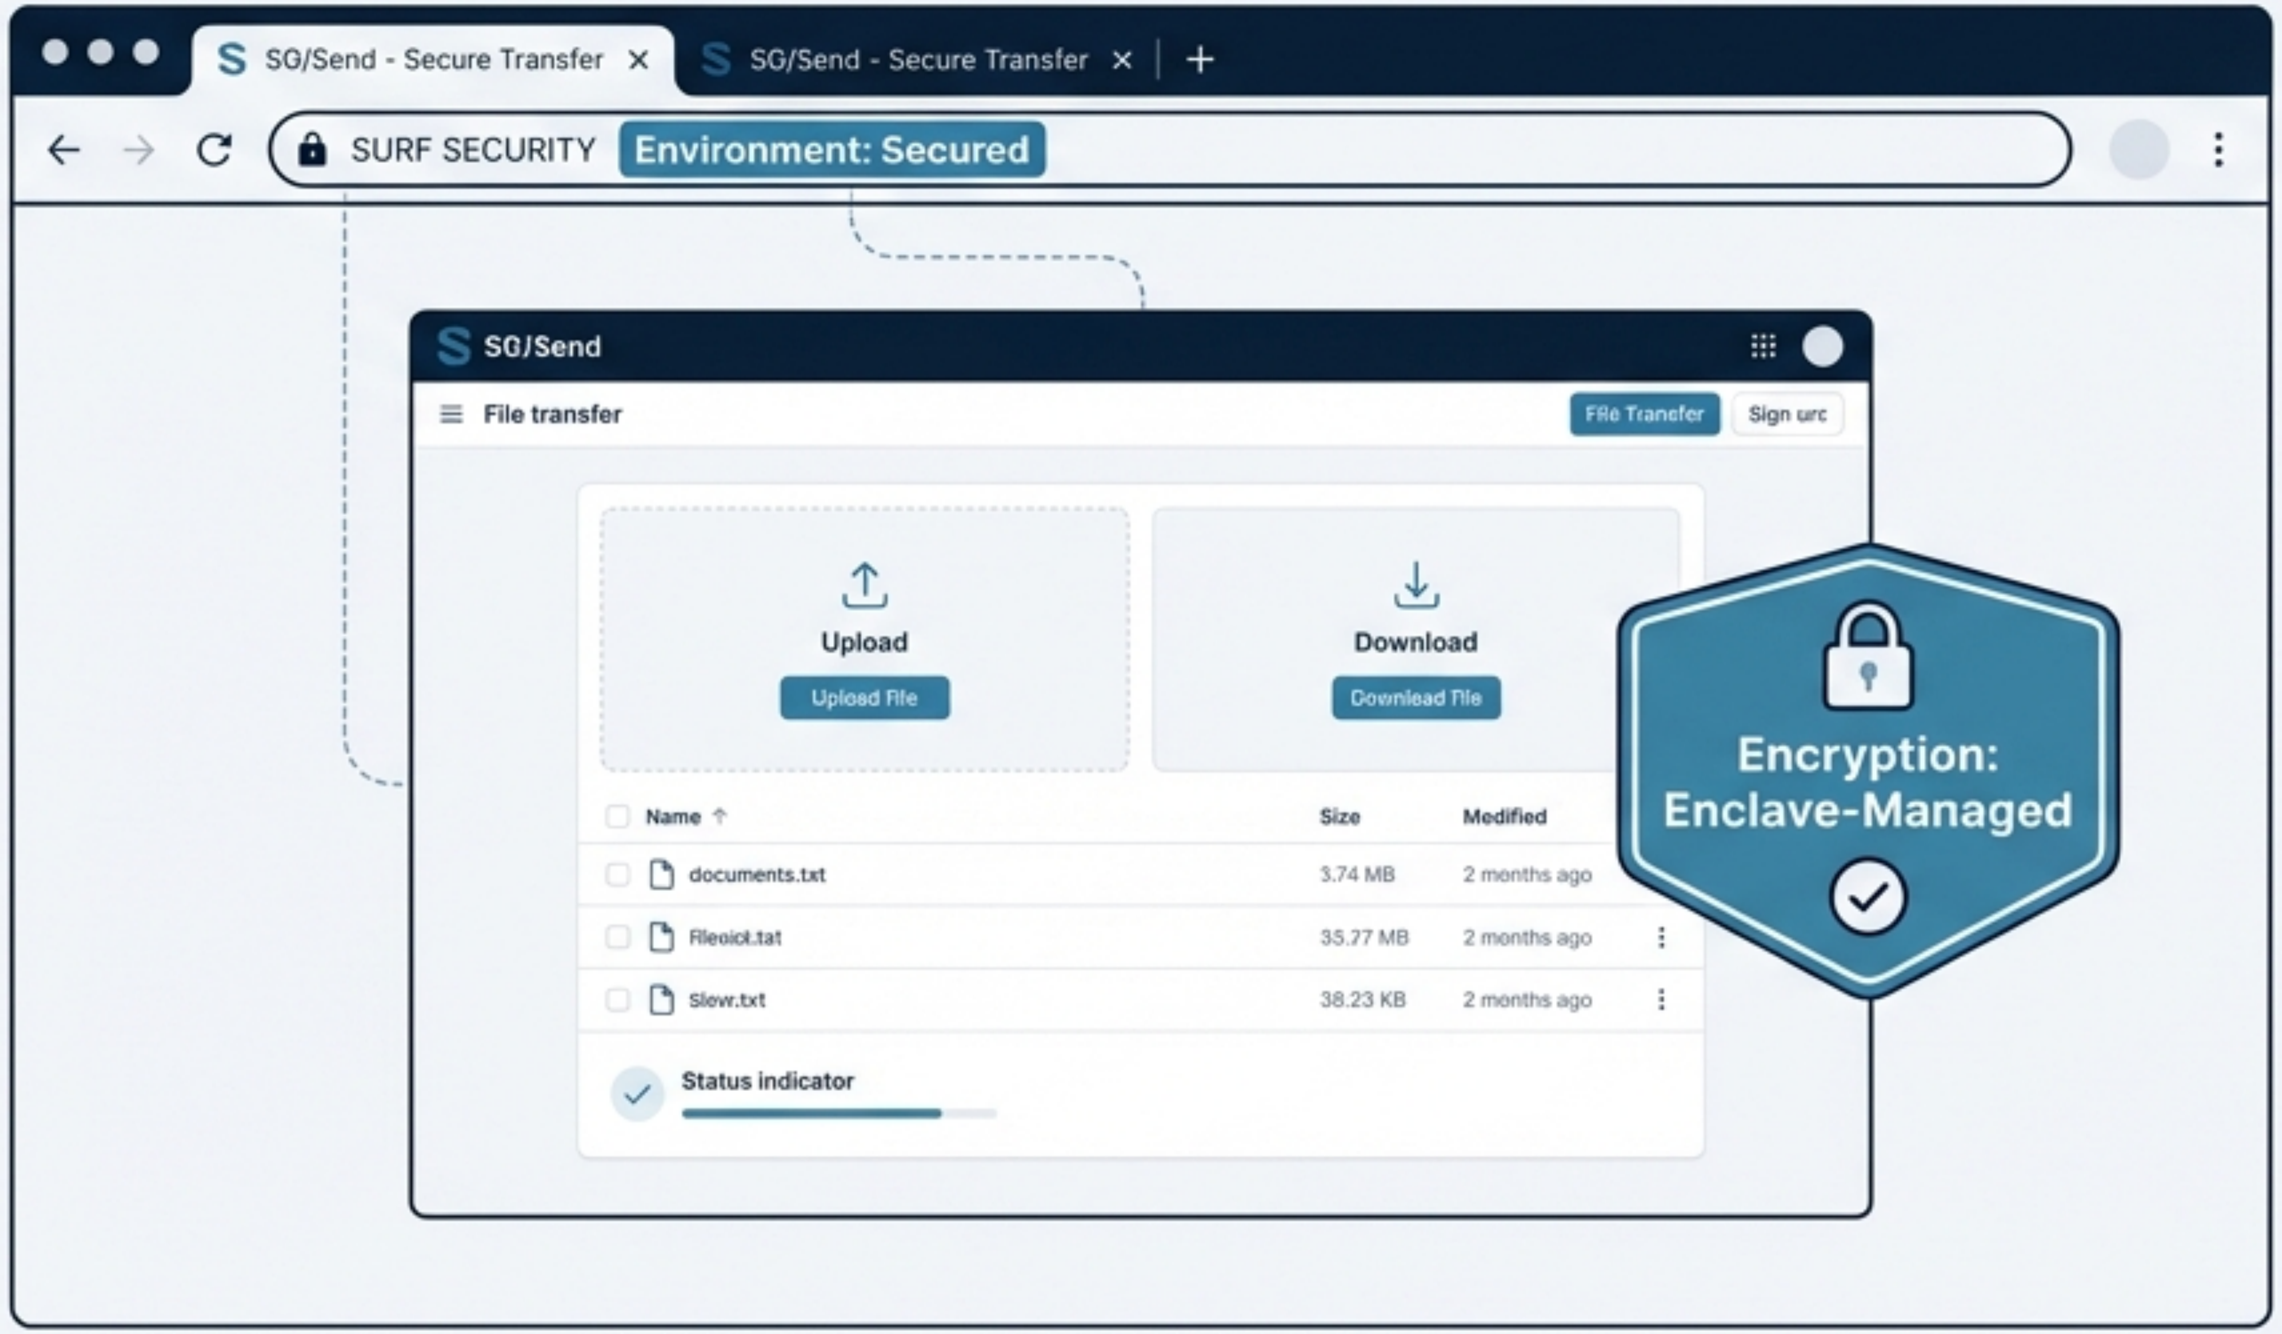
**Key Insight:** We currently rely on “Trust but Verify”, but we lack the tools to verify the endpoint's integrity.

# Shifting from Heuristics to Enforced Control

| | Standard Browser (Untrusted)  | Surf Managed Browser (Enforced)  |
|---|---|---|
| **Extensions** | Unverified / Malicious allowed | **Strictly Blocked** |
| **Data Control** | Copy-paste to OS allowed | DLP Enforced |
| **Network** | Vulnerable to interception | Guaranteed Integrity |
| **Identity** | Session hijacking risks | Validated Session Management |

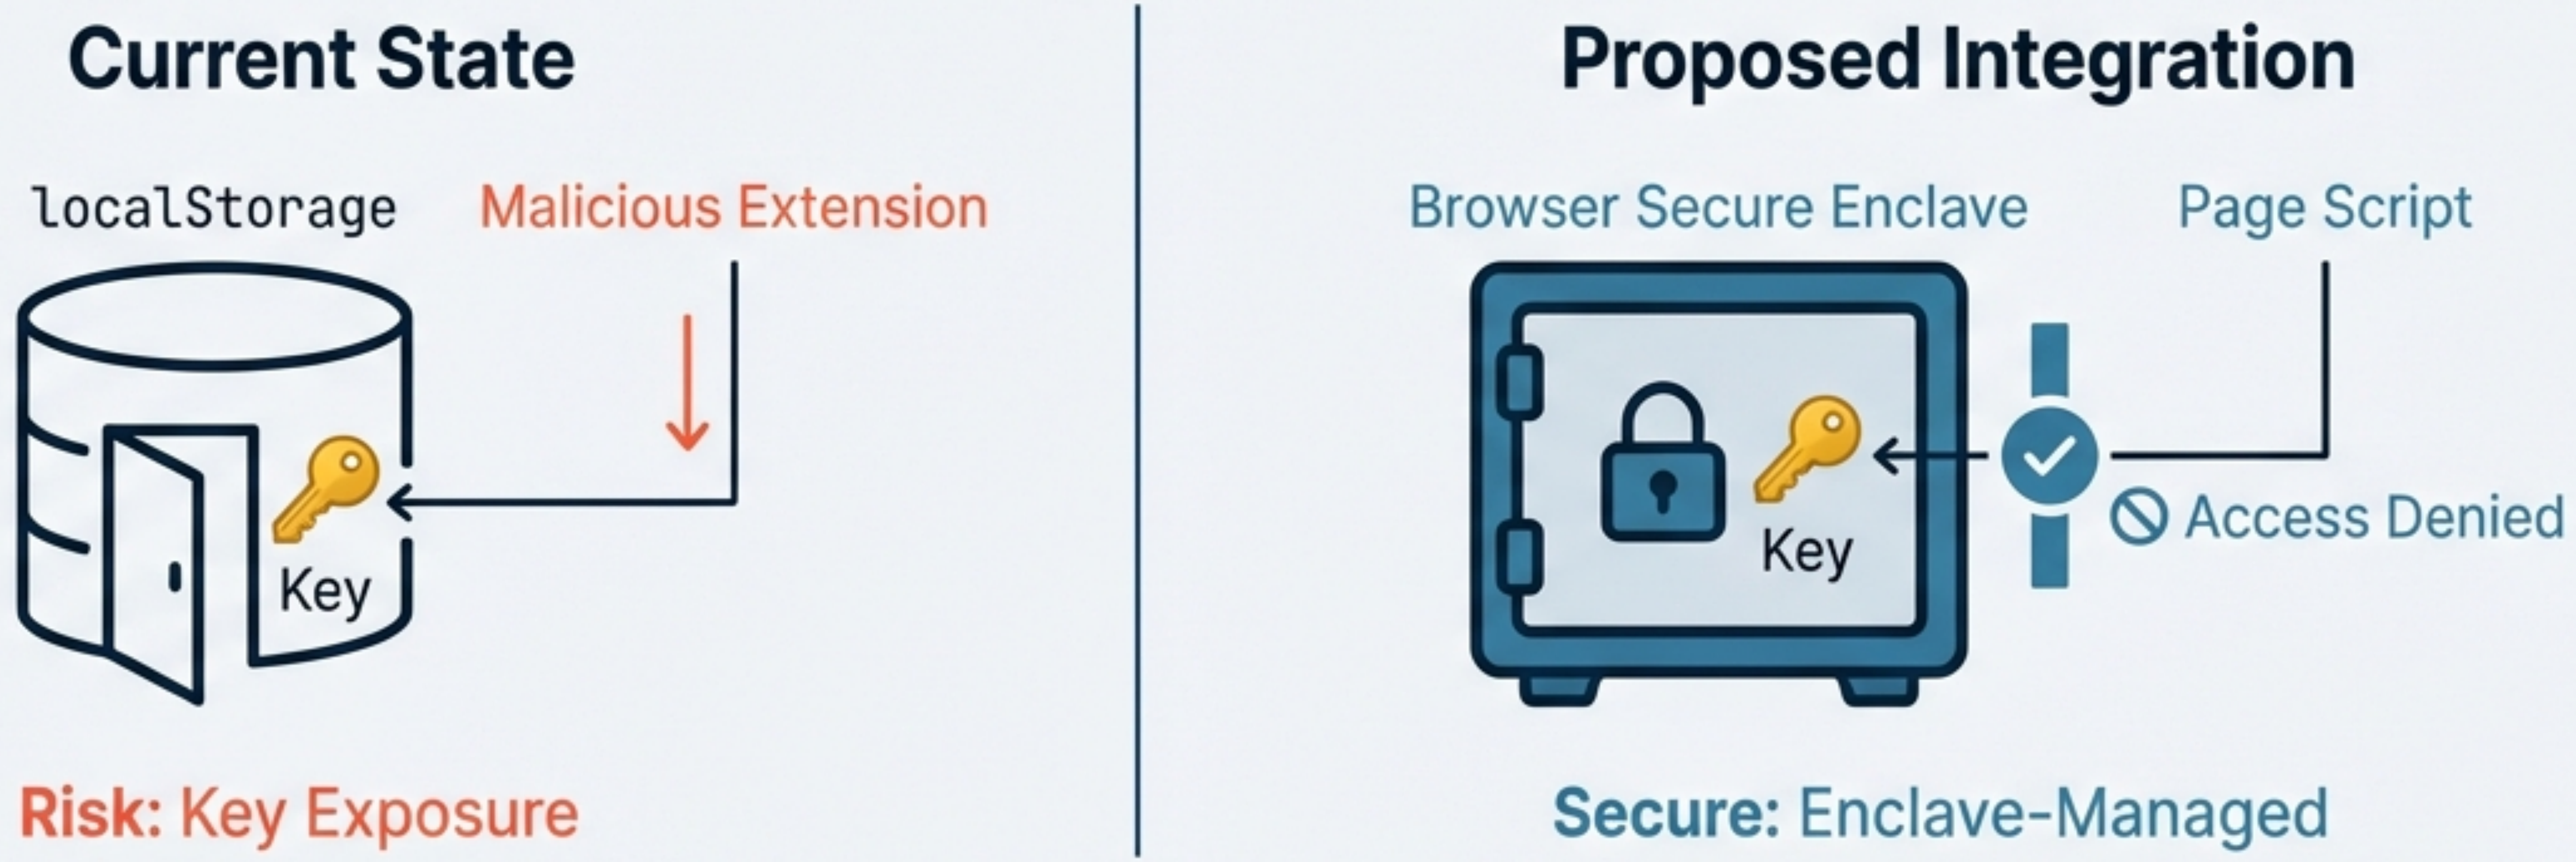
# The Vision: SG/Send Nested Inside the Secure Boundary

What if the browser was part of the encryption guarantee?



Note: Architecture applies to other enterprise browsers like Island or Talon.

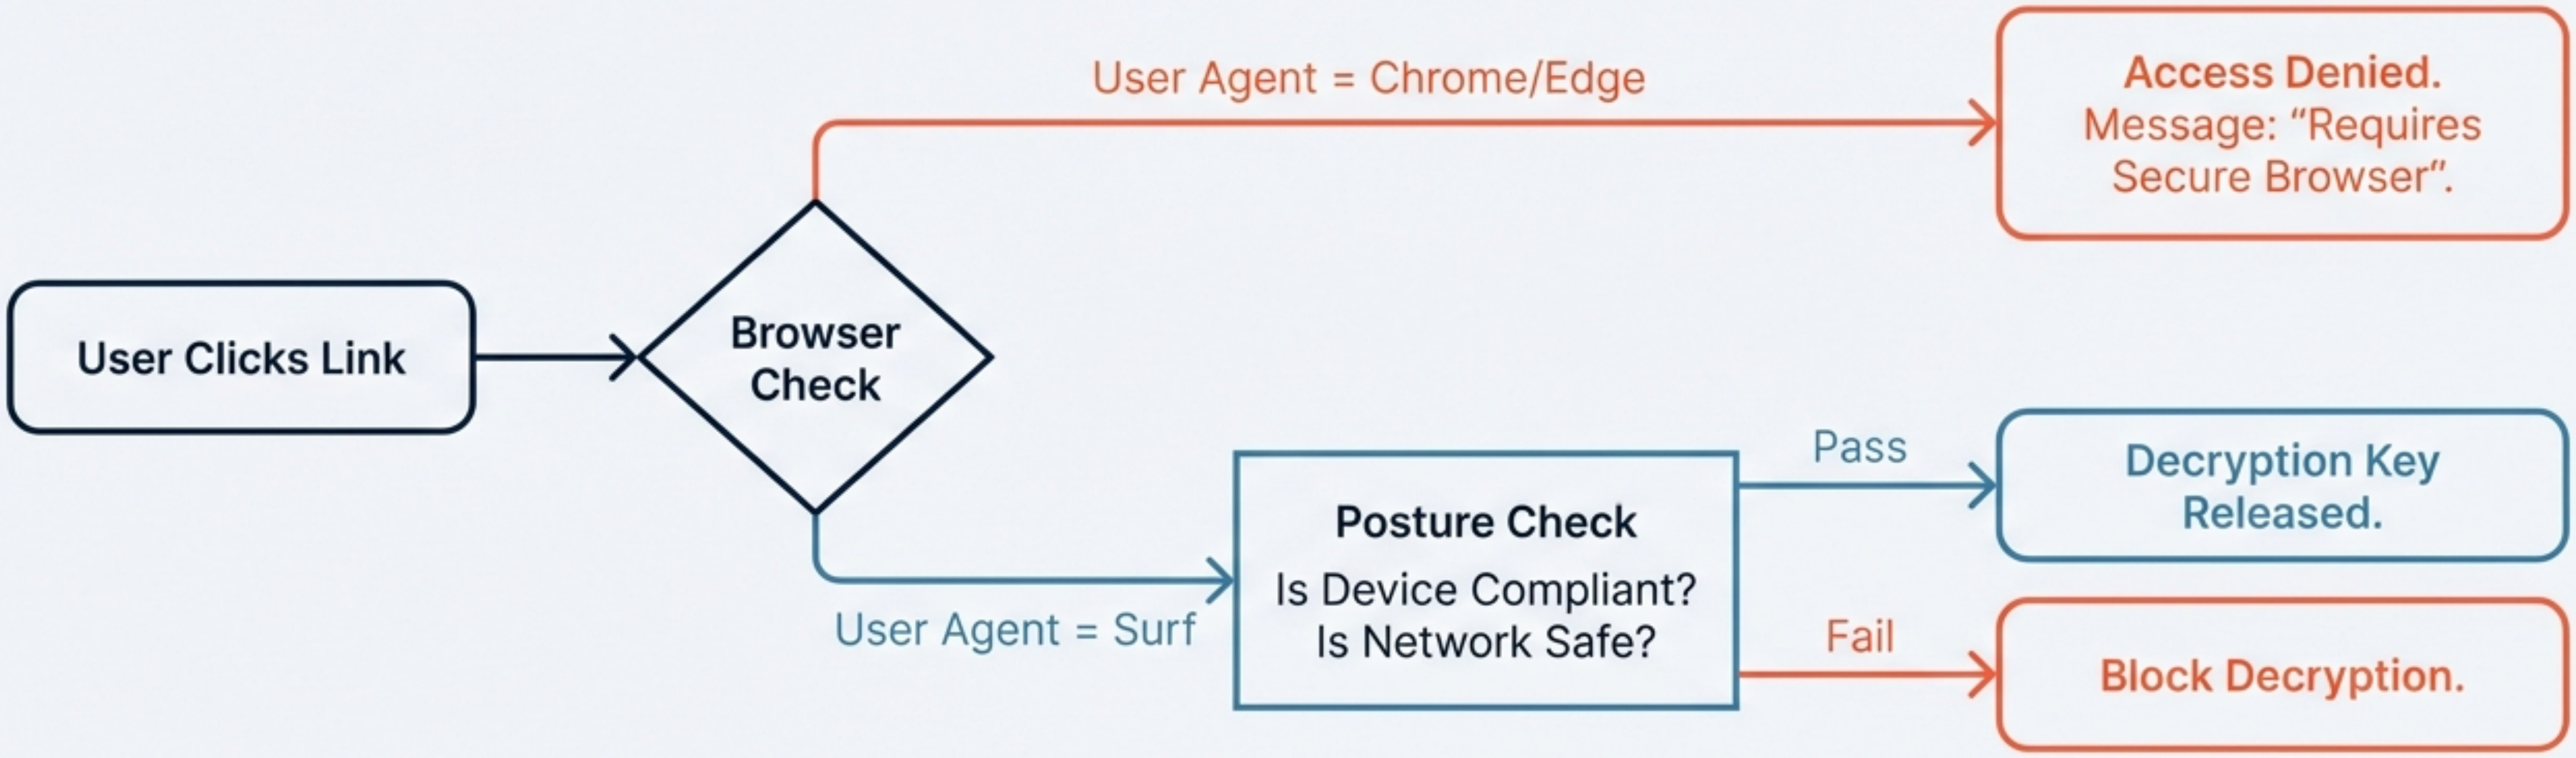
# Pillar 1: Hardened Identity & Key Management



- **Solution A:** Move keys out of vulnerable `localStorage` into browser-managed storage.
- **Solution B:** Native PKI. The browser manages the key pair. Keys never leave secure storage.

**Research Question:** Does Surf expose a protected storage API or credential store accessible to web apps?

# Pillar 2: Conditional Access & Posture Checks



**Scenario:** A bank sends a document that can strictly only be opened on a compliant corporate device.

# Pillar 3: Data Containment & The 'Glass Pane'

**True "View Once":** Content exists only in RAM and the visual layer.
Close the tab = content destroyed.

**Research Question:** Does Surf support policies that prevent file downloads and clipboard egress for specific web apps?

# The Value Proposition for Surf Security

### Differentiation

Use our browser, and your SG/Send transfers are MORE secure.

### Validation

Validates customer investment. SG/Send features only work because they bought Surf.

### Stickiness

Critical workflows become dependent on the managed browser environment.

---

"Surf's customers are security-conscious. This integration proves why they need a managed browser."

# The Strategic Value for SG/Send

## Channel Access

Direct access to Surf's enterprise customer base—a perfect overlap with our target.

## Credibility

Validation by a major enterprise security vendor.

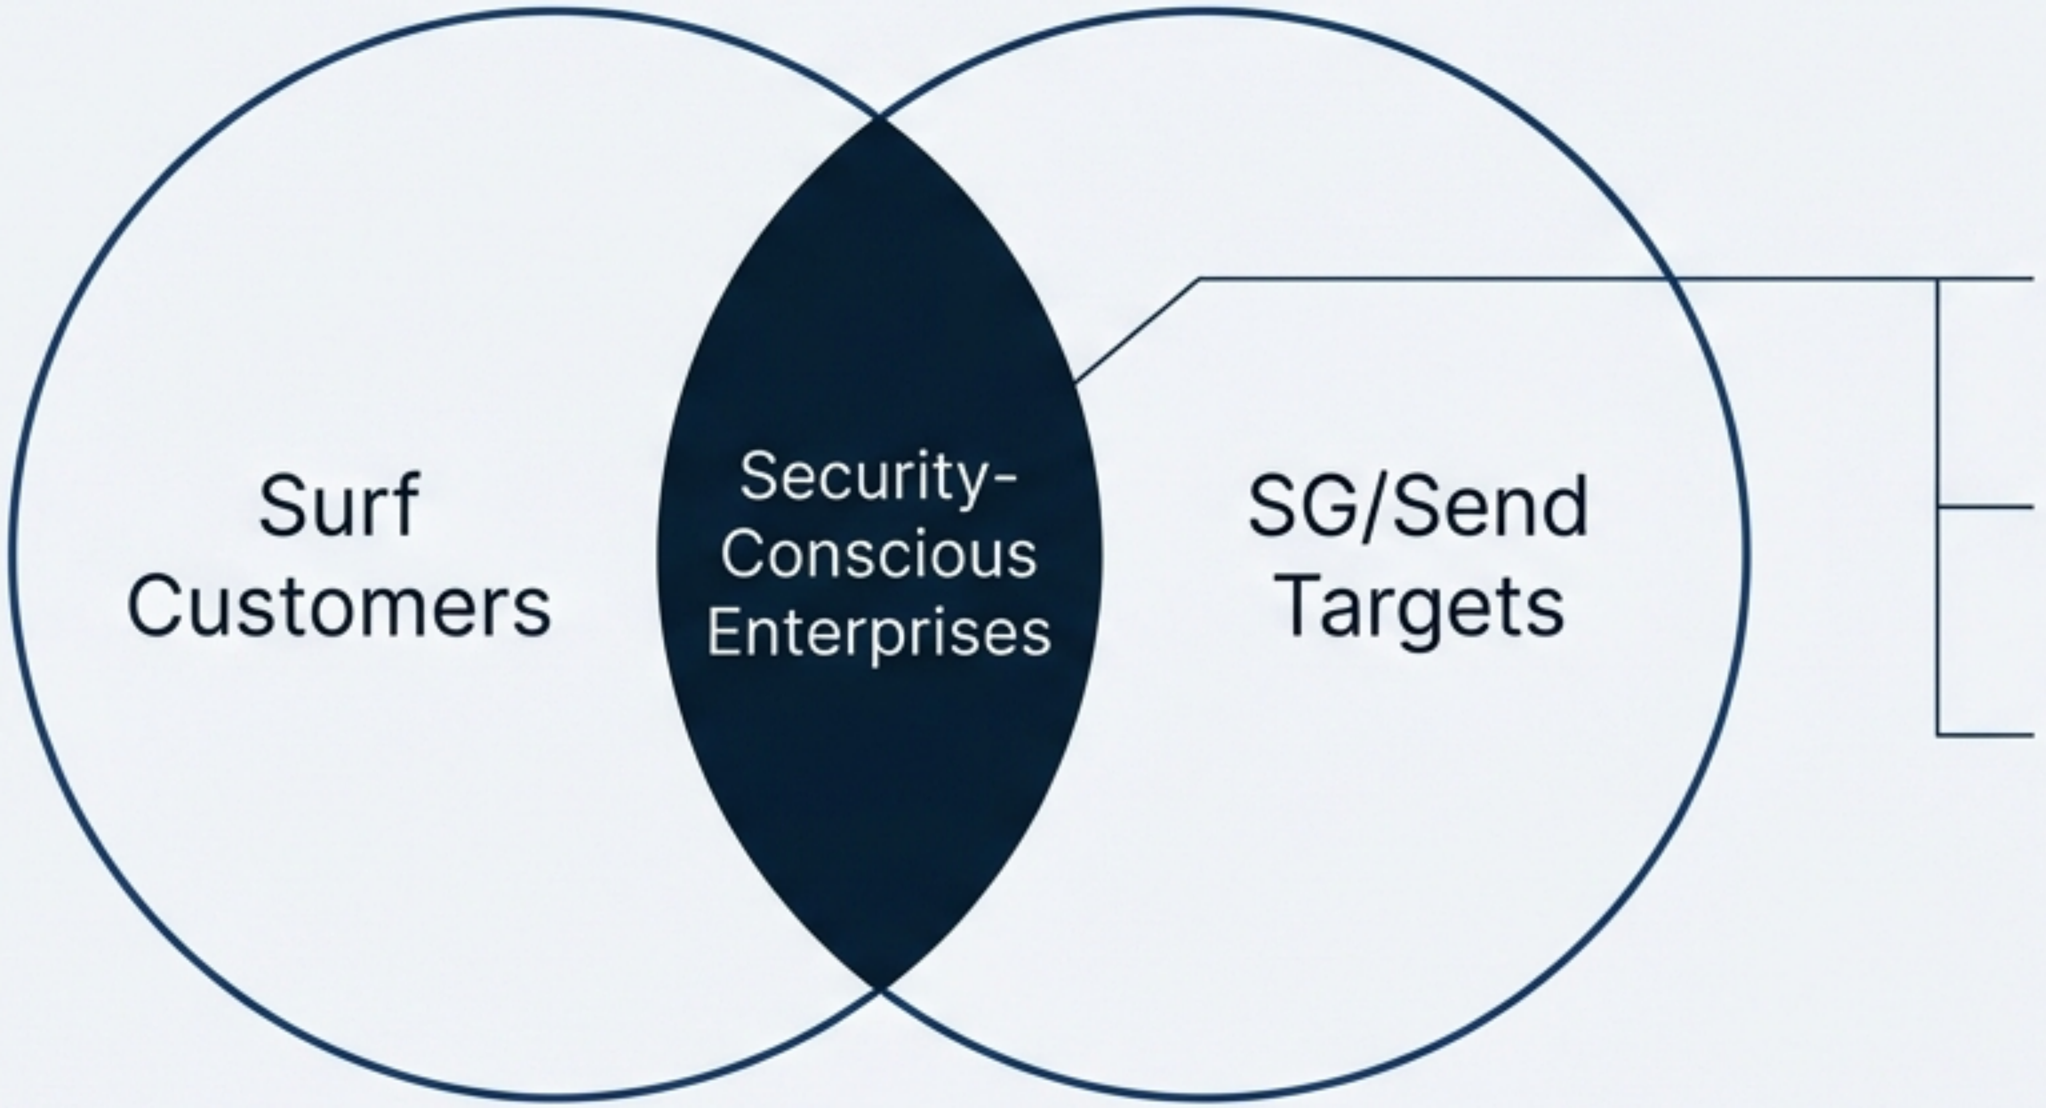
## Technical Leap

Enables features (DLP, key protection) we literally cannot build alone.

## Revenue Potential

Joint go-to-market opportunities and professional services.

# The Strategic Alignment



- Value Zero-Knowledge Encryption
- Value Two-Channel Security
- Have Budget for Browser Security

These customers have already budgeted for browser security; this integration leverages that sunk cost.

# The Enterprise Answer vs. The Heuristic Answer

Context: Building on v0.4.7 Security Review.

**General Public (Chrome/Edge)**

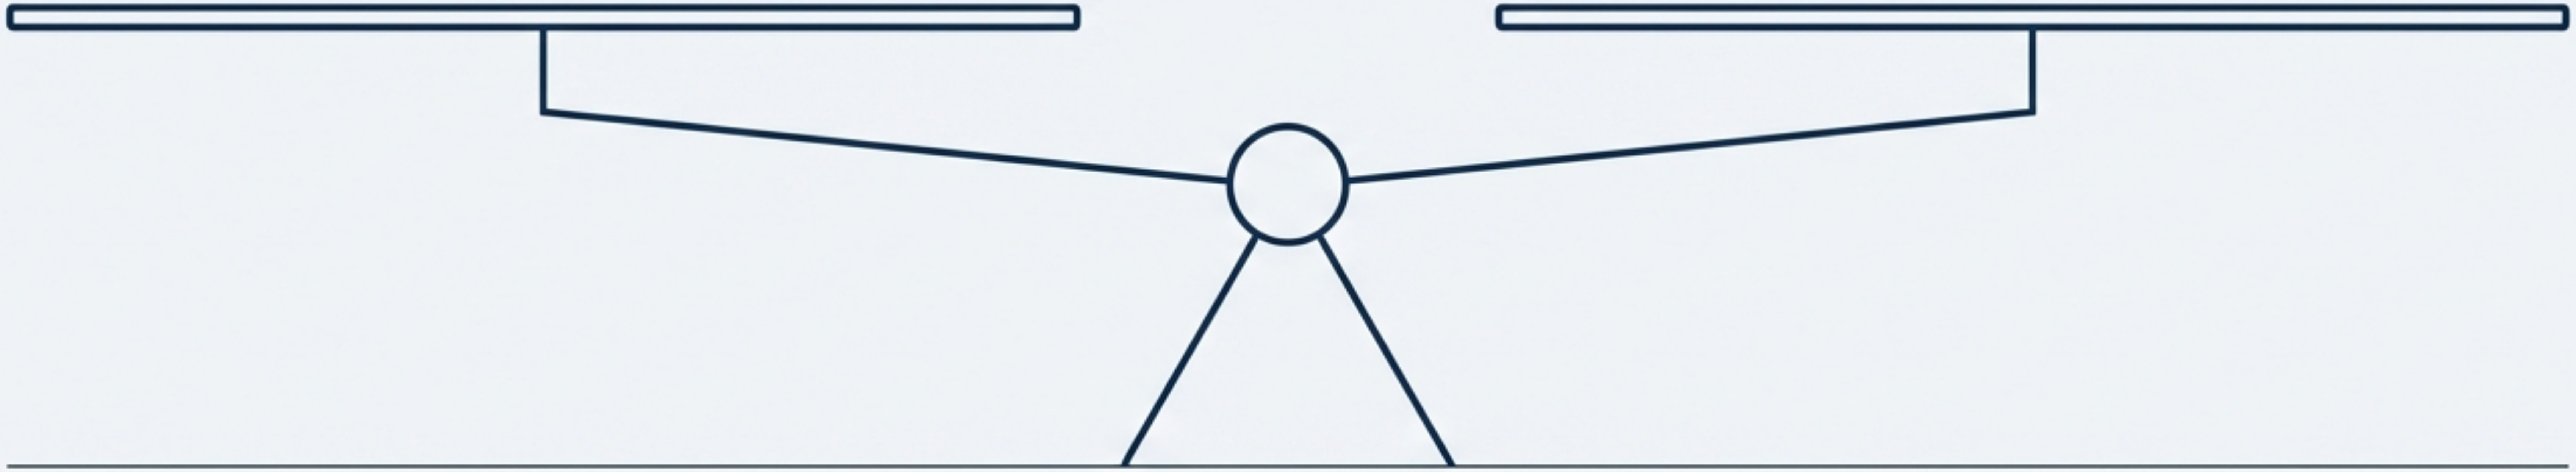
**HEURISTICS (Guessing)**

We guess if extensions are malicious. We can only warn.

**Enterprise (Surf)**

**DETERMINISM (Knowing)**

We use APIs to verify security. We can enforce policy.



The secure browser is the “solved” version of the browser security problem.

# Next Steps: From Concept to Brief

## Priority 3 (Critical)

- Research Surf API capabilities: Storage, DLP, Posture. (Owner: Architect/Dev, [redacted]
- Assess technical feasibility of the 6 Integration Ideas.
- Connect Chrome extension detection research. (Owner: AppSec, [redacted]

## Priority 4 (Secondary)

- Draft one-page partnership concept.
- Research competitor APIs (Island, Talon).

## Goal

Immediate research to validate technical feasibility.

# Defining the New Standard for Secure Transfer

This isn't just a tech integration; it is a strategic move to define a new standard for secure document transfer in the enterprise.
