SG/Send reaches its first commercial milestone with validated infrastructure.

10

Paying Customers

£5 credit packs purchased via Stripe from personal outreach.

90 Min

Ship Time

From initial user feature request to live production deployment.

300MB+

Scale Validated

Successful large-file encrypted transfers handled flawlessly.

v0.1.0

Vault Live

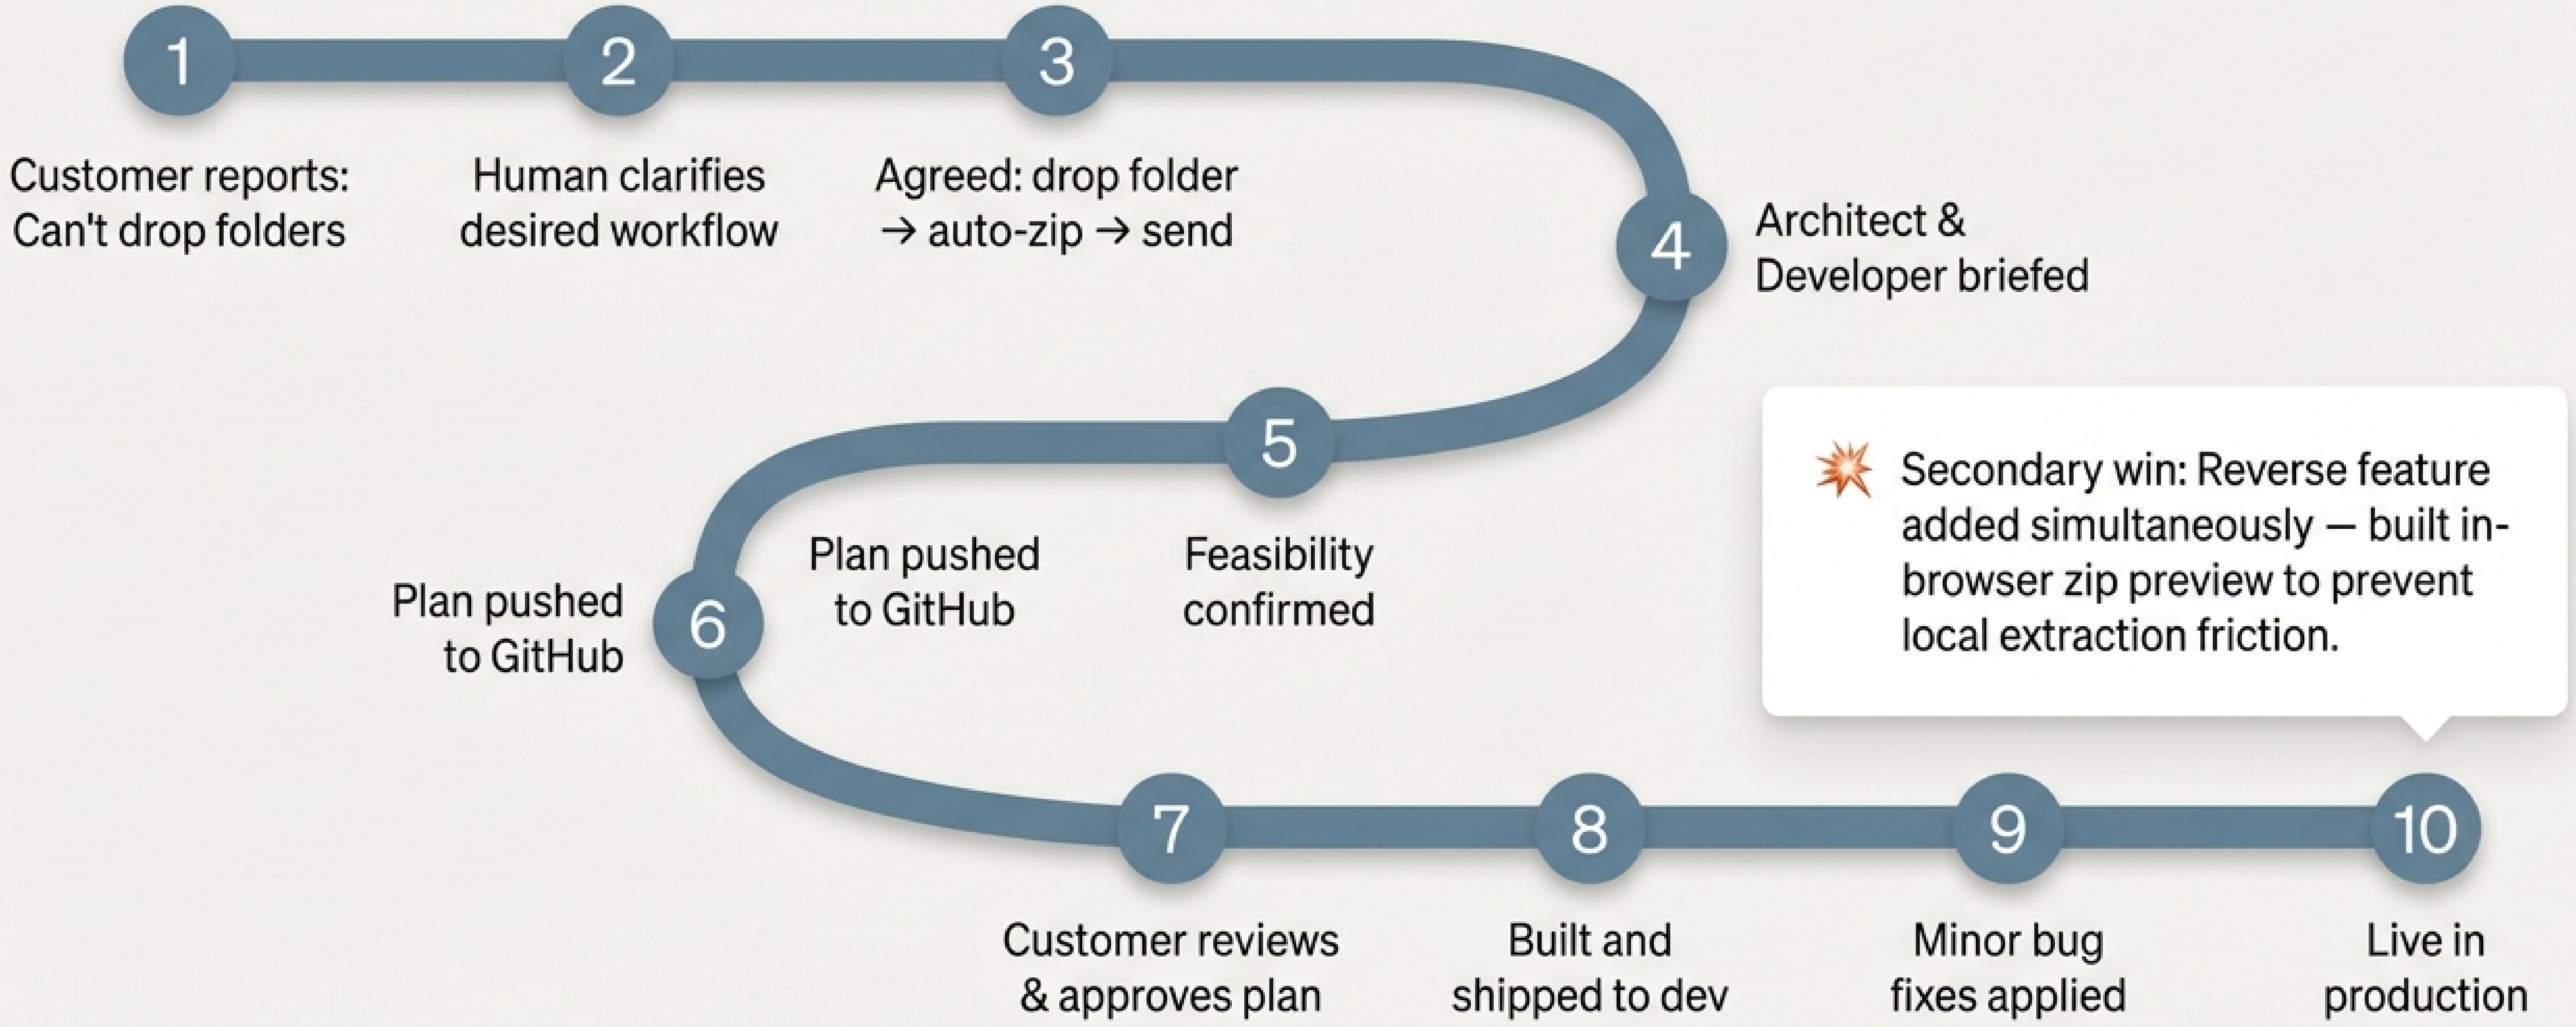
Successful deployment of the first encrypted vault MVP.

Personal outreach validates the core product credibility and purchasing flow

Signal	Meaning
10 purchases from personal outreach	People will pay when asked directly; product credibility established
Purchase flow smooth (Apple Pay/Stripe)	Early UX investments paid off; zero friction at checkout
Manual token delivery (~5 mins) successful	The human touch (thank-you + workflow tips) creates a strong initial experience
Several users declined the voucher	Users are willing to pay £5 without incentives; stronger validation than expected
300MB+ files successfully transferred	Core encrypted file transfer is solid under real-world conditions

The manual process works at this scale. Automation is P1, not P0.

Agentic development workflows enable 90-minute feature deployments



Zero-friction in-browser previews bypass the limits of traditional platforms.

Capability Matrix

- **ZIP Preview:** Browse contents, selectively view/download files
- **Video Playback:** Play directly in browser, no download required
- **Audio Playback:** Direct in-browser listening
- **PDF Preview:** Existing capability, confirmed highly stable

The SG/Send Advantage: Sending a large video file

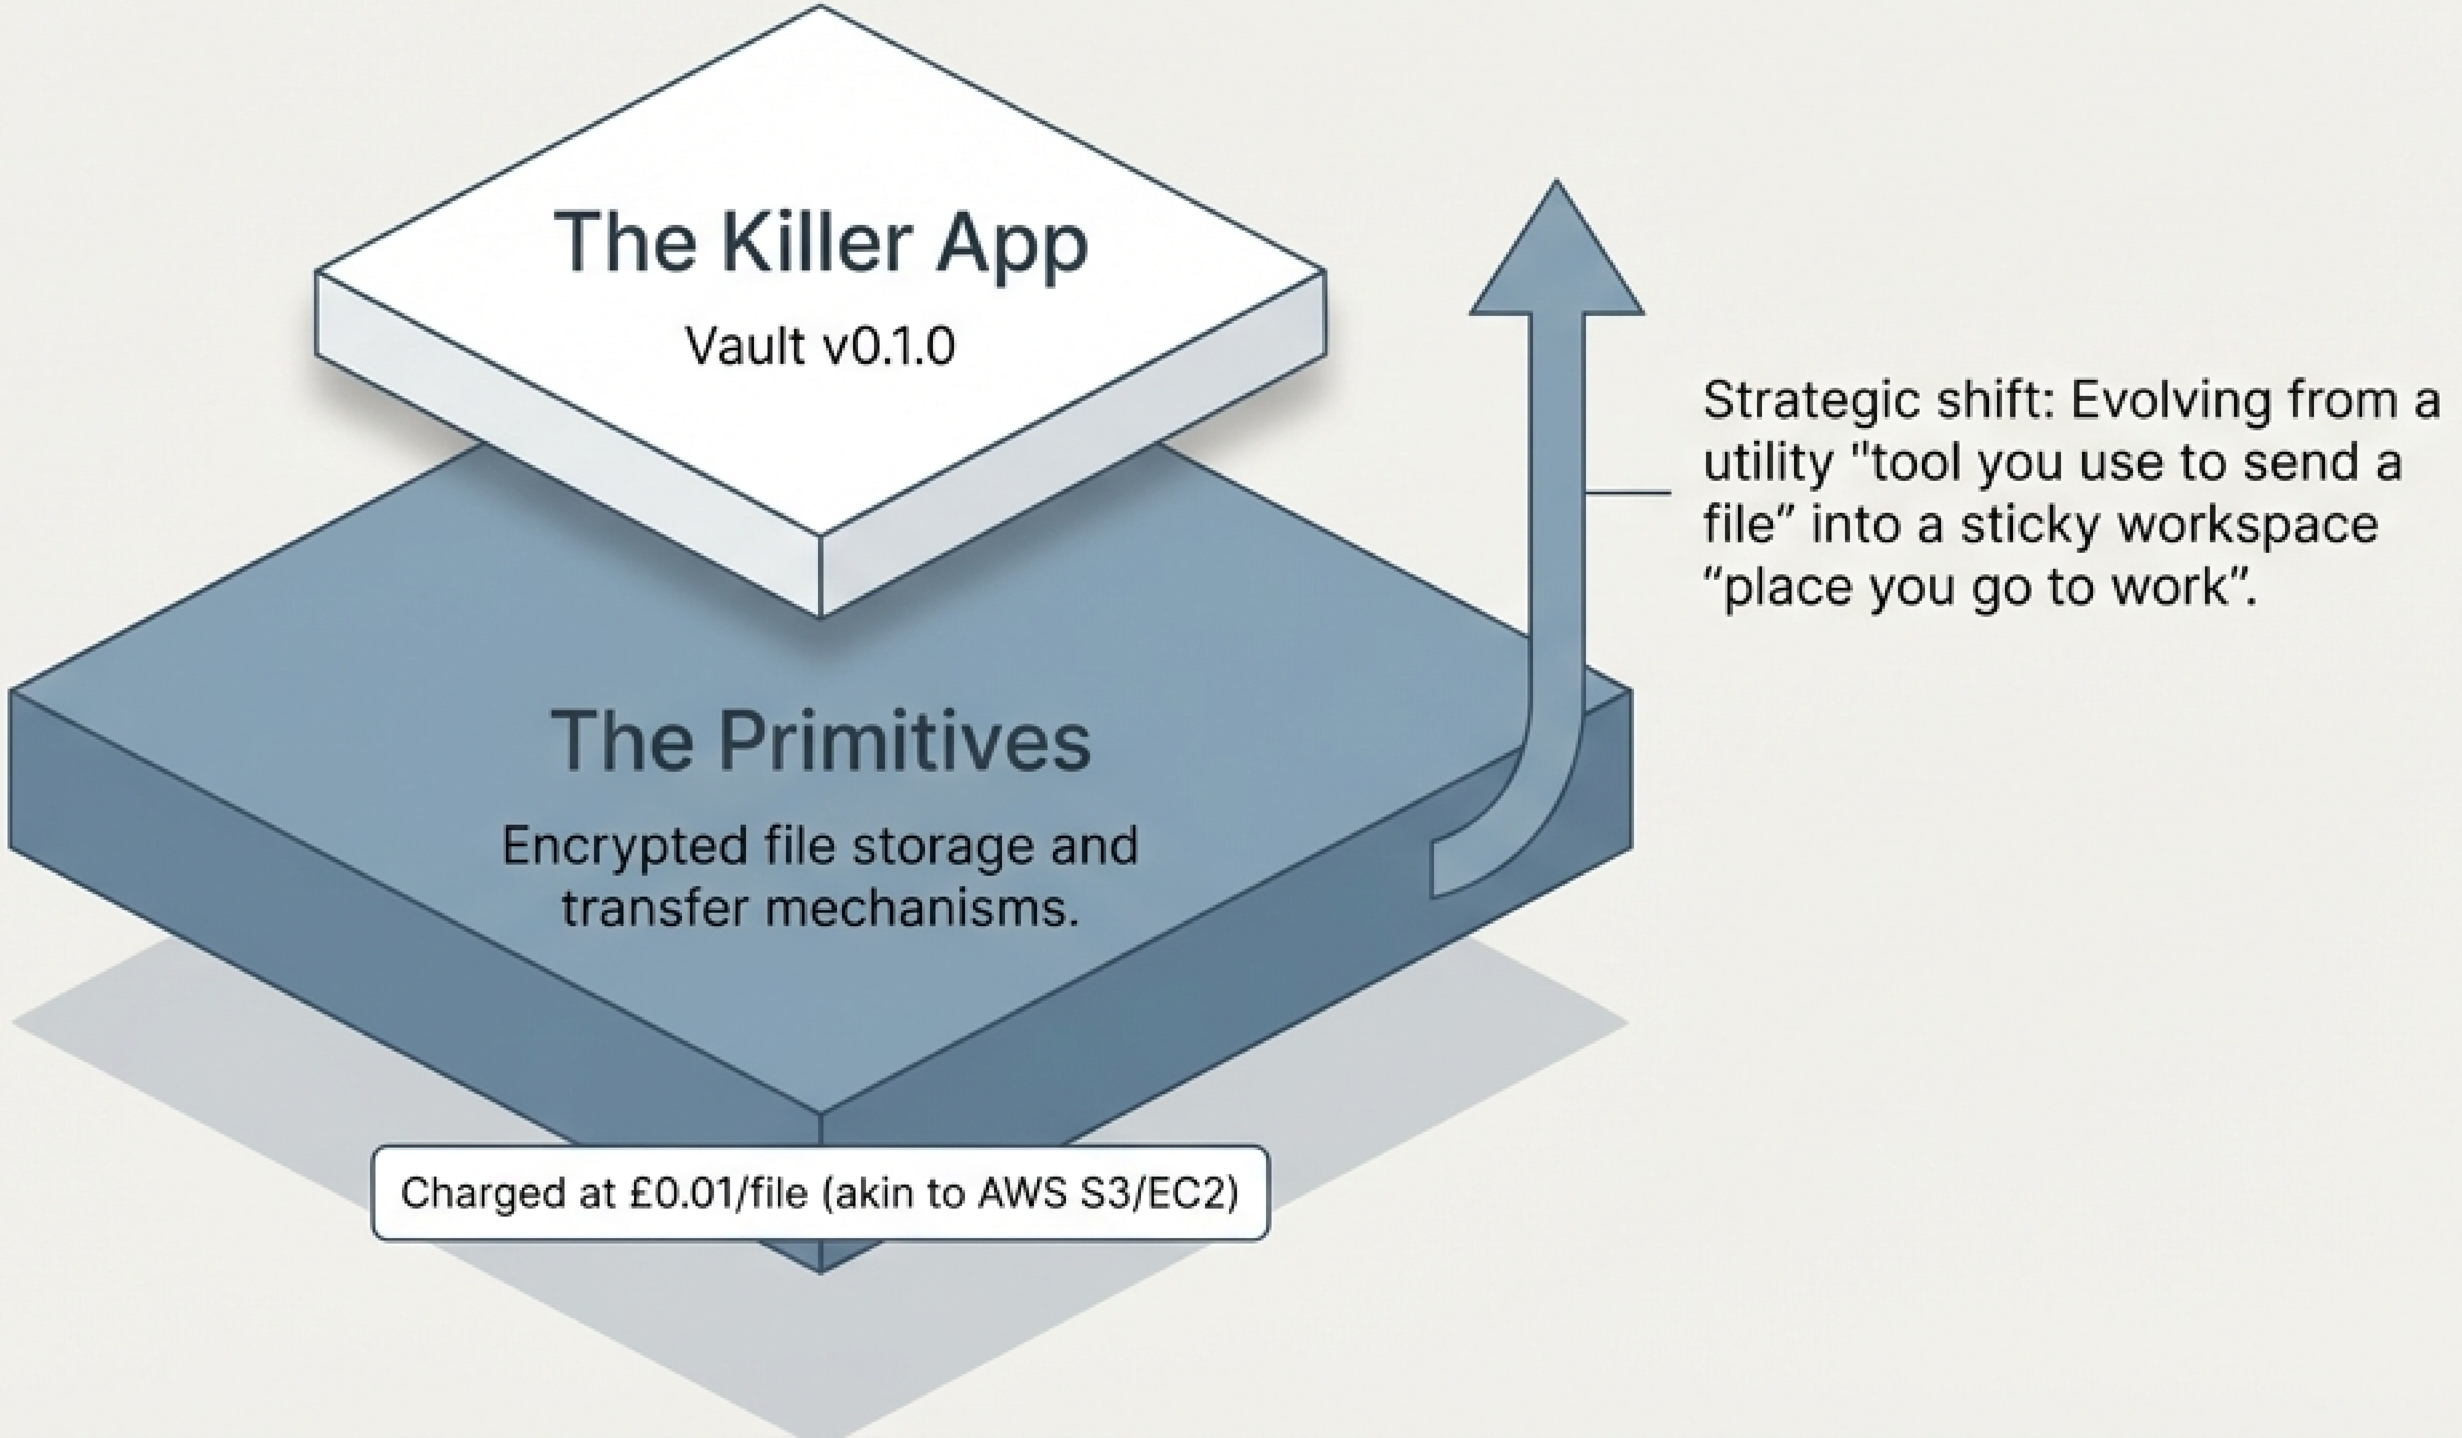
Legacy Solutions

- **WhatsApp:** 300MB limit, heavy compression
- **Email:** Strict attachment limits
- **Dropbox:** Requires download, finding a local viewer, and opening

SG/Send Workflow

Upload → Share link → Recipient clicks → Plays instantly in browser

The encrypted vault acts as the first killer app built on our core primitives.



Sustaining engagement requires distinct cadences for **early access** and paid cohorts.

EAP Users
Size: **~5-10**

Origin: Early Access Programme with free tokens.

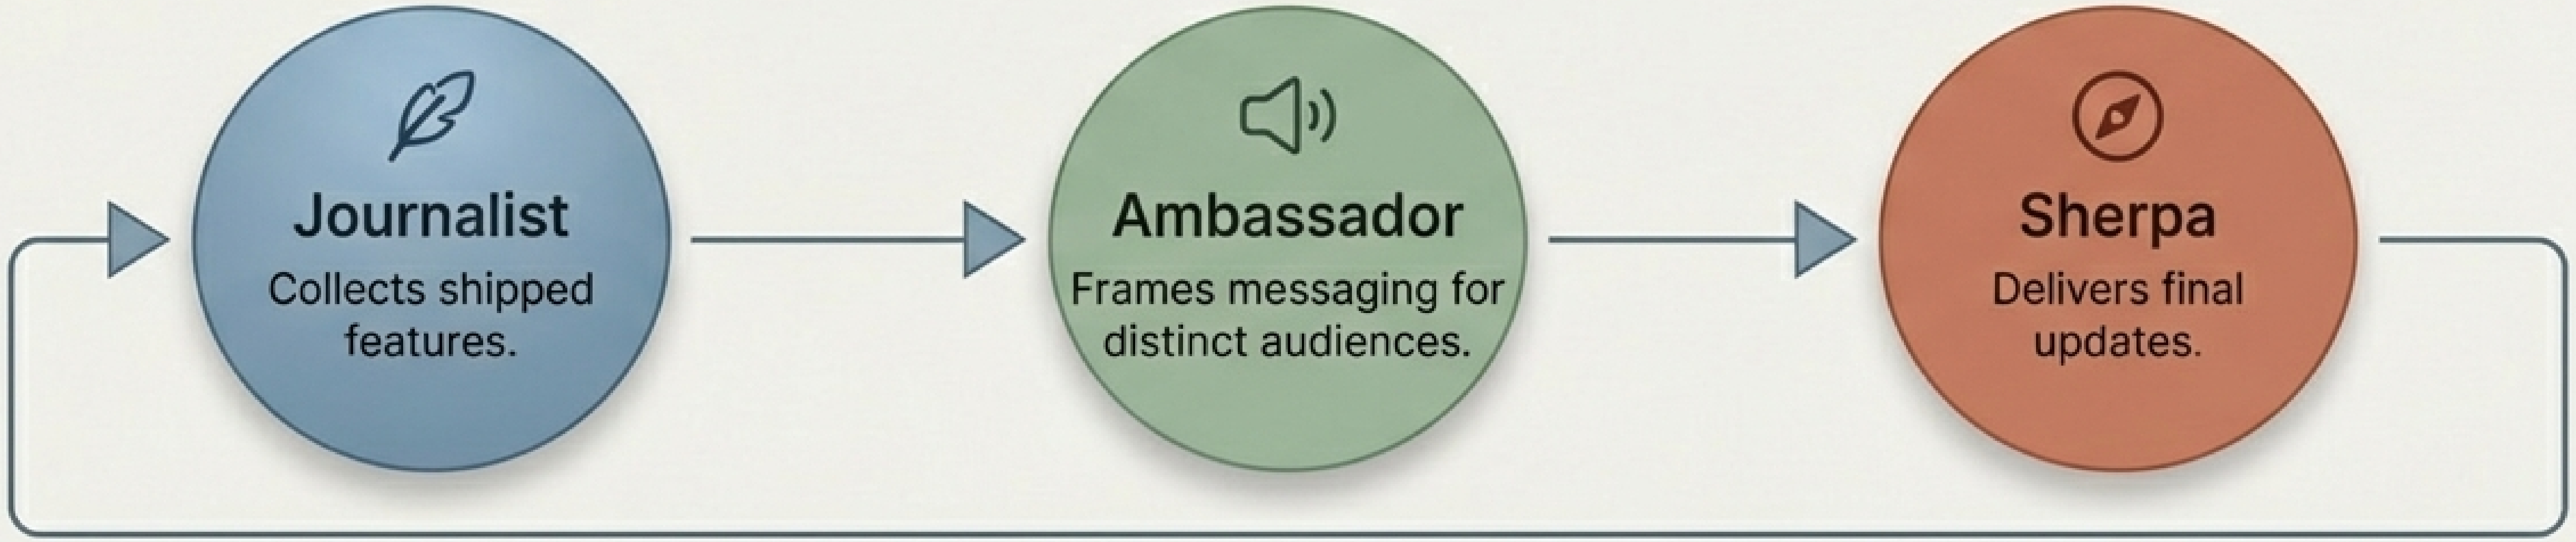
Needs: Follow-ups on updates (“We shipped a big update, here's a new access code: EAP-March-Week-1”).

Paid Customers
Size: **10**

Origin: £5 Stripe purchase via outreach.

Needs: Thank-you messages, vouchers, suggested workflows, and feature updates.

Bi-Weekly Cadence



Tracking core usage signals reveals clear technical validation and emerging behaviour.

Confirmed

- Credibility for purchase (People pay £5).
- Smooth purchase flow (Apple Pay/Stripe checkout).
- Core product scales (300MB+ files handled).
- Users request features (Folder uploads).

Watching

- "This saved me time" (Real task usage).
- Integration queries (Email/WhatsApp workflows).
- Organic usage after the first test.
- User referrals.

Noted

- Voucher declines (Extends outreach budget for further acquisition).

Immediate priorities focus on scaling the working system and stabilising the vault.

P0: The System Is Working

- Files encrypt/decrypt at 300MB+ scale.
- Apple Pay and card payments via Stripe.
- Continue manual token provisioning (works at current scale).

P1: Immediate (This Week)

- Vault fixes: folder upload bugs, drag-and-drop, metadata banners.
- Vault CLI MVP: Python/Typer, sync local ↔ vault.
- Sherpa welcome email templates.
- Stripe webhook → Accountant → Sherpa automation.

Upcoming sprints pivot towards deeper system integration and zero-touch automation.

P1: This Sprint

- Chrome sync exploration (persisting vault keys via Google sync).
- Local storage viewer (debug tool for client-side storage).
- Vault manifest for sync operations.
- Gathering direct feedback from the first 10 customers.

P2: Next Sprint

- Document transformation workspace (LLM integration).
- Full billing automation (Stripe → token → welcome email).
- Daily synthetic user tests.

The technical foundation is secure; the next phase is entirely about scale and automation.

“The system works — it just doesn’t scale yet. That’s a great problem to have.”
