

User Testing Readout: SG/Send vs The Incumbent

Version	v0.11.1
Date	5 March 2026
Audience	Ambassador, Sherpa, Design, Development
Focus	Direct user quotes, pricing signals, and feature requests

Three strategic signals from our latest user session

Core features land perfectly.

Folder sharing, link-based distribution, and pay-as-you-go preferences are exactly what the user wants.

UI and Pricing need immediate recalibration.

The recipient file list is buried, and the credit-per-file model causes friction.

An unprompted demand for a browser extension perfectly validates our upcoming Chrome extension strategy.

An unprompted demand for a browser extension perfectly validates our upcoming Chrome extension strategy.

Designing for the consumer who relies on WhatsApp and WeTransfer

Profile

Non-technical
Consumer/Prosumer.

They share files with friends. They were sent an SG/Send link and experienced the recipient flow.

The Baseline

This user expects the simplicity of a WhatsApp message but recognises its limitations with folders and large files. They default to WeTransfer when WhatsApp fails. This is the exact conversion target.

SG/Send Target

The core differentiators generated unprompted ‘that’s cool’ moments

“Drag and drop, no zip needed”

Folder Sharing: The user immediately recognised that you cannot send a folder via WhatsApp. It is a genuine differentiator.

“The whole get the link thing, I think is really cool.”

Link-Based Sharing: Moving away from email attachments resonates strongly.

“Buying exactly what is needed over a monthly subscription.”

Pay-As-You-Go: A strong, explicitly stated preference validating the credit-based model.

“I didn’t know where to look”

The Problem: The recipient view fails the primary expectation. Files are buried under metadata.

The Expectation: You just immediately see, here is what the person has sent to you.

P1 Action (Design): Redesign the recipient view. The file list must be the hero element—large, prominent, and immediately visible.

A gigabyte a pound

The Friction: The current 500-files-for-£5 model leaves users frustrated with leftover credits.

The Intuition Matrix		
Amount	Price	Feels Like
1 GB	£1	Reasonable
5 GB	£5	Good value, comparable to expected spend
500 MB Top-up	Proportional	Appealing to buy exact amounts

P1 Action (Ambassador)

Explore GB-based pricing. Verify profitability at £1/GB (which currently supports 1GB upload + 5 downloads at S3/CloudFront costs).

WeTransfer's 3-day expiry limit is a strategic vulnerability

“If you don't download a WeTransfer link in enough time, the whole thing just disappears.”

The Opportunity: The user suggested paying £1 for a week or £2 for two weeks to keep files alive.

P1 Action (Developer): Implement storage-duration billing. Set a 7-day default (beating WeTransfer) with **paid extensions** for 30 days, 90 days, or **permanent retention**.

An unprompted demand for a browser extension

The Signal: A non-technical user independently asked for SG/Send to operate natively within the browser, referencing discount extensions like Honey.

“It would be cool if it was connected to like Google or something, somehow that just naturally it’s an option.”

The Validation: This perfectly validates the current Chrome extension brief. The user wants SG/Send as a natural browser utility, not a destination website.

WhatsApp routing and download receipts

WhatsApp Integration

The user wants to 'forward to this thing and it sends via this method'.

Action: Browser extension should detect `web.whatsapp.com` and offer a seamless 'send securely via SG/Send' option.

Download Analytics

Strong positive reaction to knowing 'when your thing has been downloaded'.

Action: Implement basic sender notifications connecting to our data room access analytics work.

Find all the things WeTransfer doesn't do

	WeTransfer Free	WeTransfer Premium	SG/Send
Folder sharing	✗ (zip first)	✓	✓ (drag & drop)
Price model	Free (w/ limits)	Subscription	Pay-as-you-go
File size limit	2 GB	200 GB	5 TB
Retention	3 days	4 weeks	Billable extensions
Encryption	TLS only	TLS only	End-to-end, Zero-knowledge
Ads	✓	✗	✗

The tension between free habits and paid value

The Context: Why pay when WeTransfer is free? The barrier isn't the £5 price; it's the commitment before experiencing the quality.

Option 1: Limited Free Tier

X MB or Y files per month to generate usage, paying only when they exceed limits.

Option 2: Frictionless First Purchase

No free tier, but heavy reliance on public demo data rooms to prove value beforehand.

Option 3: Explicit Recipient Messaging

Emphasize that it is 'Free for recipients, paid for senders' to remove the sender's anxiety about burdening their friends.

Immediate Action Plan

P1		Design	Redesign recipient view (File list as hero element).
P1		Ambassador/Human	Explore GB-based pricing alongside file-based credits.
P1		Dev/Human	Set default retention > 3 days (7 days min) + build paid extensions.
P1		Dev	Add basic download notification for senders.
P1		Sherpa	Validate Chrome extension demand with wider user base.
P2		Ambassador	Publish 'SG/Send vs WeTransfer' competitive page on sgraph.ai.
P2		Human	Explore free tier or free trial credits for first-time users.
