

Brief: User Feedback — Real User Testing SG/Send (5 March 2026)

version v0.11.1

date 5 Mar 2026

from User interview (recorded)

to Ambassador (lead), Sherpa, Designer, Developer

type User feedback — direct quotes, pricing signals, feature requests

Who Is This User?

A real person who was sent an SG/Send link and experienced the recipient flow. Not a technical user. Represents the consumer/prosumer segment — someone who shares files with friends, knows WeTransfer, uses WhatsApp for file sharing. This is exactly the audience we need to convert.

What They Liked

Folder sharing is genuinely differentiated. The user immediately identified that you cannot send a folder via WhatsApp — you have to use WeTransfer. This is a real pain point they recognised without prompting. The folder capability landed as a genuine "that's cool" moment.

The link-based sharing model. "The whole get the link thing, I think is really cool." The concept of sharing via a link rather than attaching files resonated.

Pay-as-you-go over subscription. Strong preference for buying exactly what you need rather than committing to a subscription. This validates the credit-based model over monthly plans.

What Needs Improvement

1. File List Visibility — "I didn't know where to look"

The problem: When the recipient opens a shared folder link, the file list is too small relative to the rest of the UI. The user didn't immediately see what files were in the folder. Their expectation: "you just immediately see, here is what the person has sent to you."

What they want: Clear, prominent display of the folder contents — the folder name, then the files inside it, clearly bracketed and easy to scan. The files should be the first thing the recipient sees, not something they have to find.

Action for Designer: The recipient view for folder/zip shares needs a redesign where the file list is the hero element. Large, prominent, immediately visible. The current view makes the files too small relative to the decryption and metadata UI elements. This connects directly to the data room viewer and gallery viewer work — purpose-built views where the content is 90% of the screen.

2. Pricing: Gigabytes Over File Count

The problem: The current model is credit-per-file (500 files for £5). The user finds this unintuitive — "you might buy five quids worth of credits, and then you only use four quids worth, and you're just given

a pound."

What they want: Pricing in gigabytes. "A gigabyte a pound" felt right to them. Buy exactly the amount of data you need to send. No leftover credits. No subscription commitment.

The user's pricing intuition:

Amount	Price	Feels Like
1 GB	£1	Reasonable
5 GB	£5	Good value, comparable to what they'd consider paying
Granular top-up (e.g., 500 MB)	Proportional	Appealing — "buy the exact amount you're going to use"

Comparison with WeTransfer: The user knows WeTransfer's free tier (2GB, files expire in 3 days). They know the premium tier exists (subscription). Their complaint: "you have to commit to a whole subscription to send 500MB over the free limit." A pay-per-GB model would directly address this gap.

Action for pricing strategy: Consider offering both models — file-based credits (current, good for many small files) and GB-based credits (good for large file senders). Or simplify to GB-only. The user's instinct that £1/GB is fair is worth testing. At that price, we need to verify profitability: a 1GB file uploaded and downloaded 5 times = 6GB of bandwidth. At current S3/CloudFront costs, £1 for 1GB upload + 5 downloads is still profitable, but margins are thinner than the per-file model.

3. File Expiry: WeTransfer's 3-Day Limit Is Annoying

The problem: "If you don't download a WeTransfer link in enough time, the whole thing just disappears." The user finds this frustrating.

Opportunity: SG/Send can differentiate by offering longer retention. The human suggested: perhaps charge an additional £1 for a week, or £2 for two weeks. This aligns with the storage-duration billing primitive from the v0.10.30 strategic signals brief.

Action: Default retention should be longer than WeTransfer's free tier (3 days). A 7-day default with paid extension options (30 days, 90 days, permanent) would address this pain point and create a revenue stream.

4. Browser Extension — Unprompted Request

The most significant signal in this conversation. The user independently, without being prompted, asked for a browser extension. Their reference: Honey (the discount code extension that integrates into the browser and "just comes up as a thing").

What they want: SG/Send as a natural part of the browser, not a separate website you have to navigate to. "It would be cool if it was connected to like Google or something, somehow that just naturally it's an option."

Why this matters: This is an unprompted validation of the Chrome extension brief we wrote today. A non-technical consumer user independently arrived at "I want this as a browser extension" without knowing we're already designing one. The user is telling us the distribution strategy is correct.

The WhatsApp integration angle: The user also mentioned wanting to share files from within WhatsApp conversations — "forward to this thing and it sends via this method." This is beyond what a

Chrome extension can do on mobile, but it validates the "share via" integration model. On desktop, a browser extension could detect when you're on web.whatsapp.com and offer "send securely via SG/Send" as an option.

5. Download Notifications

The user responded positively to the mention of download notifications — "you can see when your thing has been downloaded." This connects to the access analytics work from the data room enhancements brief. The user wants to know: did the recipient actually open what I sent?

Competitive Positioning vs WeTransfer

The user's framing was consistently "how is this different from WeTransfer?" This is the competitive benchmark for the consumer/prosumer segment. The user identified the differentiators themselves:

Feature	WeTransfer Free	WeTransfer Premium	SG/Send
Folder sharing	✗ (zip first)	✓	✓ (drag and drop, no zip needed)
Price model	Free (with limits)	Subscription (~£10/month)	Pay-as-you-go (£5 for credits)
File size limit	2 GB	200 GB	5 TB (stated)
Retention	3 days	4 weeks	Longer (TBD, billable)
Encryption	TLS only	TLS only	End-to-end, zero-knowledge
Download notification	✓ (premium)	✓	🔧 (building)
Ads	✓ (free tier)	✗	✗
Browser extension	✗	✗	🔧 (building)

The user's advice: "Find all the things WeTransfer doesn't do." They're telling us the positioning: not "we're an encrypted WeTransfer" but "we do what WeTransfer can't."

The Free Tier Question

The user raised a real tension: "WeTransfer is free... they get money from ads." The implicit question: why would I pay for SG/Send when WeTransfer is free?

Options to address this:

1. **Limited free tier.** Free users get X MB or Y files per month. Enough to try the product and experience the quality. Paid when they need more. This is what WeTransfer does — free tier generates usage, premium converts power users.
2. **No free tier, but frictionless first purchase.** The current £5 entry point is low, but it's still a purchase. The user needs to experience the product before deciding to pay. The public demo data rooms on sgraph.ai/demos/ partially address this.

3. **Free for recipients, paid for senders.** Recipients never pay. Senders buy credits. This is already how it works — but making it explicit in messaging removes a barrier ("will the person I'm sending to need to pay?").

The user didn't say they wouldn't pay — they said the pay-as-you-go model is appealing compared to WeTransfer's subscription. The barrier isn't price, it's commitment.

Immediate Actions from This Feedback

#	Action	Owner	Priority
1	Redesign recipient view: file list as hero element, immediately visible, large and clear	Designer	P1
2	Explore GB-based pricing alongside file-based credits	Ambassador, Human	P1
3	Set default retention > 3 days (7 days minimum), with paid extensions	Developer, Human	P1
4	Add download notification to sender (even basic: "your file was downloaded")	Developer	P1
5	Validate Chrome extension demand with more users (this is N=1 but unprompted)	Sherpa	P1
6	Competitive positioning page: "SG/Send vs WeTransfer" on sgraph.ai	Ambassador	P2
7	Explore free tier or free trial credits for first-time users	Human	P2
