

THE ZERO-KNOWLEDGE TRANSFER PROTOCOL

Your browser is the lock. Your browser is the key.

Encryption at Source: Files are encrypted in your browser before they go anywhere.

Zero Knowledge: The server holds encrypted data. The decryption key stays with you.

Frictionless: No account. No app to install. Just a modern browser.

Who holds the master key?

THE STANDARD

Encryption at Rest.

They hold the keys. They can read your files if compelled. (e.g. WeTransfer, Drive, Dropbox)

SG/SEND

Zero-Knowledge Encryption.

You hold the only key. It is mathematically impossible for us to read your data.

Three modes for secure transfer.

File Send

Parallel uploads for speed.
Supports up to 1GB.

Text Mode

Securely share passwords, API keys, or notes. Replaces pasting secrets into Slack.

Encrypted Vault

A personal "safe deposit box" in the browser for secure storage.

The Mechanics of Zero-Knowledge.

Maximum Security: Splitting the Channel.

Two channels, one transfer. If the email is intercepted, the link is useless without the key from the second channel.

We show you exactly what we know.

Transparency Receipt

```
// DATA LOG - SESSION ID: 0x4A9B2C7D //
```

STORED DATA (VISIBLE TO US)

```
Hash of IP Address: [a1b2...f6g7]
```

Upload Timestamp: [2024-10-27 14:35:02]

File Size: [15.4 MB]

Encryption Method: [AES-256-GCM]

NEVER STORED (INVISIBLE TO US)

~~Original IP Address: [REDACTED]~~

❌ File Name: [REDACTED]

 File Content: [REDACTED]

~~❏~~ Decryption Key: [REDACTED]

// END OF LOG //

We show you this panel after every download because we think you should know.

When “I just emailed it” isn’t good enough.

The Professional

Contracts, tax returns, HR docs.

The Developer

API keys, secrets, config files.

The Consultant

Client files where apps cannot be installed.

The Team

A secure, drop-in replacement for WeTransfer.

The Landscape of Private Sharing

	SG/SEND	WeTransfer	Tresorit
Zero-Knowledge Encryption	✓	✗	✓
Open Source Code	✓	✗	✗
No Account Required	✓	-	✗
Self-Hostable	✓	-	✗

We aren't trying to be the biggest (1GB limit).
We are the tool for when privacy *actually* matters.

The AI is the workshop. The product is the furniture.

The Workshop
(AI Build Process)

The Furniture
(The Product)

Zero AI in Production: No hallucinations. No AI processing your files.
Deterministic: Standard Python backend, vanilla JavaScript frontend.
You use the furniture; you never interact with the workshop.

Don't take our word for it. Read the code.

Licensed under the Apache Licence,
Version 2.0

- ❑ **Public Repository:** The zero-knowledge promise is verifiable.
- ❑ **Self-Hostable:** Deploy SG/Send on your own infrastructure.
- **Standard Crypto:** Uses well-understood Web Crypto API, not proprietary magic.

What SG/Send is not.

- ☐ Not a Dropbox replacement (No syncing or collaboration).
- ☐ Not for massive files (1GB limit vs WeTransfer's 200GB).
- ☐ Not Anonymous (We store a hash of your IP).
- ☐ Not Enterprise Certified (No SOC 2 or HIPAA yet. Beta software.)

The Privacy Checklist.

- ✓ Encryption happens before upload.
- ✓ Server never sees the key.
- ✓ No account required for sender or recipient.
- ✓ Open source & auditable code.
- ✓ No AI inside the production runtime.

Secure your transfer now.

send.sgraph.ai

1.

Go to
send.sgraph.ai

2.

Drop a file.

3.

Share the link.

Private file sharing that works like you'd expect.
