

Cyber Boardroom × SG/Send

Advisory Architecture & Technical Infrastructure Integration

REACTIVATING THE CYBER BOARDROOM THROUGH AGENTIC INFRASTRUCTURE

- The original vision was paused because the required agentic infrastructure did not yet exist.

- We are not rebuilding a new product from scratch.

- The Cyber Boardroom is now a direct packaging of SG/Send's agentic infrastructure for the cybersecurity board advisory market.

BOARDS REQUIRE TRANSLATION, NOT EDUCATION

- Board members are sharp but lack deep cybersecurity expertise.

- CISOs struggle to package technical messages into business risk narratives.

- Mission: Deploy Athena to help executives communicate in the board's native language.

MANUAL ADVISORY MODELS FUNDAMENTALLY BREAK AT SCALE

- **Target buyers are CISOs** doing advisory work and consulting firms.
- **Companies refuse to pay** for 10–20 days of consulting for a single boardroom briefing.
- Consultants **lack the capacity** to execute this manually for multiple clients.
- **The market remains undersized** because the economics are unviable.

SG/Send provides the missing technical foundations

Historical Barriers		SG/Send Realities	
	Sensitive board materials	Zero-knowledge encrypted data rooms	✓
	Research and packaging	18-role agent team (CLAUDE.md) & Issues-FS	✓
	Safe file sharing	Core encrypted transfer product	✓
	Scalable deployment	Claude Code Web + scoped MCP	✓
	Multi-stakeholder comms	Sherpa inbox & multi-agent email	✓

Agent-assisted workflows transform the unit economics

The 80%: Mini agent teams handle research, structured questionnaires, and drafting.

The 20%: The human consultant focuses purely on judgment, relationship building, and boardroom presence.

Result: A single CISO advisor can now serve 5-10 board clients simultaneously.

Every Cyber Boardroom deployment is an SG/Send environment

Verifiable agentic workspaces solve the corporate trust deficit

Kickstarting the market with open-source templates

cbr-engagement-template
IBM Plex Sans

Path 1: Generic Template

Sector-neutral configuration. Any CISO can fork, customise, and deploy for their clients instantly.

Path 2: SG/Send Dogfood Version

The Cyber Boardroom applied directly to SG/Send itself.

Demonstrating the workflow via our own infrastructure

This dual-purpose workflow proves the concept to public companies while actively driving adoption of the underlying SG/Send platform.

Capturing the symmetric market while PKI matures

- Full execution of the original vision requires mature PKI (per-recipient encryption, verified identities).
- However, SG/Send already commands a viable, immediate market in symmetric-mode file transfers and one-time secrets.
- Cyber Boardroom can ride this existing market today while building toward the PKI-enabled future.

Validating an infrastructure model that extends beyond cyber

- The revenue model shifts from usage-based (transfers) to engagement-based (per-client deployment).
- Every vertical is simply a repackaging of the same core infrastructure combined with domain-specific CLAUDE.md roles and sector templates.

Phased rollout from open-source repository to productisation

From ahead of its time to an idea whose time has come

- The vision of Athena translating cyber risk for boards was correct.
- With SG/Send's verifiable architecture, the technical and economic barriers are finally removed.
- The infrastructure is ready. The market is waiting.
