

Vibe Coding for Product-Market Fit

A Rapid Prototyping Workflow for User Experience Discovery

Validating Desire Before Committing Engineering Resources

The Speculation Trap

Building full-scale features based on internal roadmaps often leads to wasted engineering cycles on unproven value.

The Validation Loop

Our goal is to elicit an enthusiastic "Yes, I want this!" from pilot customers before writing production code.

Key Objective
Customer-Defined Success

Let reactions define value, not speculation.

Key Objective
Speed and Iteration

Prioritise exploratory building over polished code.

Key Objective
The "Vibe" Approach

Prototypes must feel live and tangible.

The Vibe Coding Philosophy

Definition: A low-friction approach where Product Leads build live prototypes using AI-assisted coding to test hypotheses in real-time.

Live Feel

Prototypes are not static mockups. They are snapshots of the site presented as interactive experiences.

Disposable Code

Code can be manual or unoptimised. The objective is learning. If it works, we rebuild it properly later.

Agile Adjustment

The workflow permits real-time pivots. We 'feel out' the product fit through continuous tweaking.

Architecture of a Filtered Browsing Experience

The Sandbox Toolkit

Intelligence (The Brains)

LLMs:
Programmatic content
alteration (e.g., 'Remove
negative sentiment')
JetBrains Mono

AI Coding Assistants:
Tools like Cursor/ChatGPT
generating Python/JS scripts
JetBrains Mono

Empowering Non-Engineers

Infrastructure (The Backbone)

Proxy & Cache:
Delivery System
JetBrains Mono

Cloud Storage (S3):
Versioned Page Storage
JetBrains Mono

APIs (Interfaced via Code):
• Fetch Page
• Save Page Version
• List Versions
JetBrains Mono

Distinct Roles for Agility and Stability

The Architect

CTO / Chief AI Officer

Roboto, Technical Blue

- **Focus:** Stability, Scalability, Empowerment.
- **Action:** Builds the MITM proxy infrastructure and documents APIs.

```
// Platform_Builder::InitializeProxy(config);
```

- **Constraint:** Does not build individual prototypes. Ensures the platform is robust.

The Vibe Coders

CEO & CPO

Roboto, Energetic Coral

- **Focus:** Discovery, UX, Speed.
- **Action:** Drivers of the workflow. Use AI assistants to write scripts.

```
// AI_Assistant.generate('experiment_script.py', user_prompt);
```

- **Method:** Leverages past technical experience to guide AI agents (e.g., Cursor) in generating code. Focus on utility, not code quality.

The Discovery Cycle

From Hypothesis to Code with AI

1. Define Hypothesis

Identify pain points.

2. Retrieve

Pull raw HTML using the API.

3. AI Modification

Prompt

Remove any paragraphs with negative sentiment. Reorder reviews to top.

Black Box

Code

JetBrains Mono

```
script.py  
calling  
save_page_versi  
on()
```

MODERN ARCHITECTURAL BLUEPRINT

SCALE: N.T.S.

PROJECT: VIBE CODING

SECTION

A-6

Validation and Scaled Testing

Step 4: The Preview

Visually verify changes for broken layouts or glitches using side-by-side iframes.

Step 5: The Proxy Test

Configure a real browser with a specific version cookie. Test interactivity and "feel".

Step 6: Scaling

Apply the successful transformation script to multiple URLs to prove consistency across the site.

The Customer Feedback Loop

Steps 7 & 8: The only opinion that matters is the customer's.

TECHNICAL NOTE

Negative feedback is valuable: It prevents waste on unwanted features.

MODERN ARCHITECTURAL BLUEPRINT

SCALE: N.T.S.

PROJECT:
VIBE CODING

SECTION A-8

Measuring the Success of Discovery

Velocity

Multiple prototype experiments created per week.

Realism

Demonstrating via proxy, avoiding static 'slideware'.

Validation

High customer enthusiasm for at least one feature.

FEAT. EKTHUSIASM >88%

Empowerment

Product team testing ideas without engineering bottlenecks.

NO BOTTLECKXS

“Experimentation leads to Revelation.”

MODERN ARCHITECTURAL BLUEPRINT

SCALE: N.T.S.
PROJECT: VIBE CODING

SECTION A-9

Bridging the Gap from Prototype to Production

IMPLEMENTATION TASKS			
	1. Real-time Automation: Moving from cached/offline to live transformation.		
	2. Codification: Converting LLM logic into efficient code rules.		
			3. Integration: Adding user controls and settings.
			
			4. Metrics: Establishing production success tracking.

VIBE CODING

SECTION A-11

Ready to Experiment

We have the infrastructure. We have the tools. We have the process.

The team is now equipped to materialise ideas instantly. It is time to explore, experiment, and find the winning formula that makes customers say: "This is exactly what we need!"
