

Pre-Launch UX Audit: SG/Send Challenge

An objective analysis of the paths from intent to action.

Scope:	sgraph.ai homepage
Path A:	Buy Credits
Path B:	Early Access
Audience:	Leadership & Engineering

The campaign relies on users arriving with specific intent

Persona: The Intentful Buyer

They are primed by a friend to 'go do this thing.' They arrive with money ready.
Stakes: £5 ROI per participant to test the end-to-end funnel with real users.

The current site actively prevents users from completing the challenge

[Severity: Critical Breakdown]

- The primary paths from intent to action are structurally broken.
- The information architecture maps to the builder's org chart, not the user's task.
- Launching outreach now will test the website's bad navigation, not the product.

Giving us money currently requires 3 clicks and 3 scrolls

Note: The alternative mid-page path requires even more friction: 4 clicks, 4 scrolls.

Friction Map (Path A)

The primary call to action is hidden and inverted

The user is told to 'buy £5 of credits', but must judge between two CTAs that do not match their instructions. This splits traffic into dead ends.

Users are forced to scroll past philosophy to reach pricing

Intentful buyers do not need convincing. Explanatory content acts as a concrete barrier.

/pricing/ page

/pricing/cloud/ detour page

Eight pricing options create immediate decision paralysis

90%+ of users need exactly one of two things: "join free" or "buy £5 credits".

Internal product matrices are leaking into the user interface.

The early access path ejects users and breaks the trust chain

Principle Violated: Never break the trust chain. Ejecting a user to a third-party domain with different branding and their email in the URL destroys zero-knowledge trust instantly.

The site's form currently contradicts its function

The site teaches before it enables. When interface affordances don't match destinations, trust degrades.

Launching now guarantees a contaminated feedback loop

If website navigation remains the primary friction source, we will spend our £5 ROI learning nothing about the zero-knowledge encryption product itself.

Four independent reviews reached the exact same conclusion

The problem is not the product. The problem is that the site stands between the user and the product.

Hostile to Intent.
The homepage blocks the
Intentful Buyer persona.

6 Friction Points.
Mapped severe navigation
blocks across both paths.

Broken Loop. The viral
loop breaks at the very
first link.

Structural Failure.
Hierarchy, affordance, and
honesty principles violated.

Halt the campaign launch until five minimum viable fixes are deployed

[Action Required]

We cannot send a single WhatsApp message for the Challenge until the primary conversion paths are restructured. Everything else can wait.

Fix 1 & 2: Create one-click paths directly from the hero

Eliminate all intermediate pages. “Buy Credits” must be the visually primary call-to-action during the Challenge campaign.

Fix 3 & 4: Correct visual hierarchy and collapse options

The site must enable first, and explain second. Explanatory content must never block users ready to act.

HIERARCHY FIX

[CRITICAL PATHS SIMPLIFIED]

Fix 5: Keep the entire experience within the **SG/Send** trust boundary

Restore honest design. The confirmation must stay within the sgraph.ai domain. Protect the trust chain at all costs.
