

Vision: Content Trust Infrastructure

PKI-Signed Facts and Source Attribution

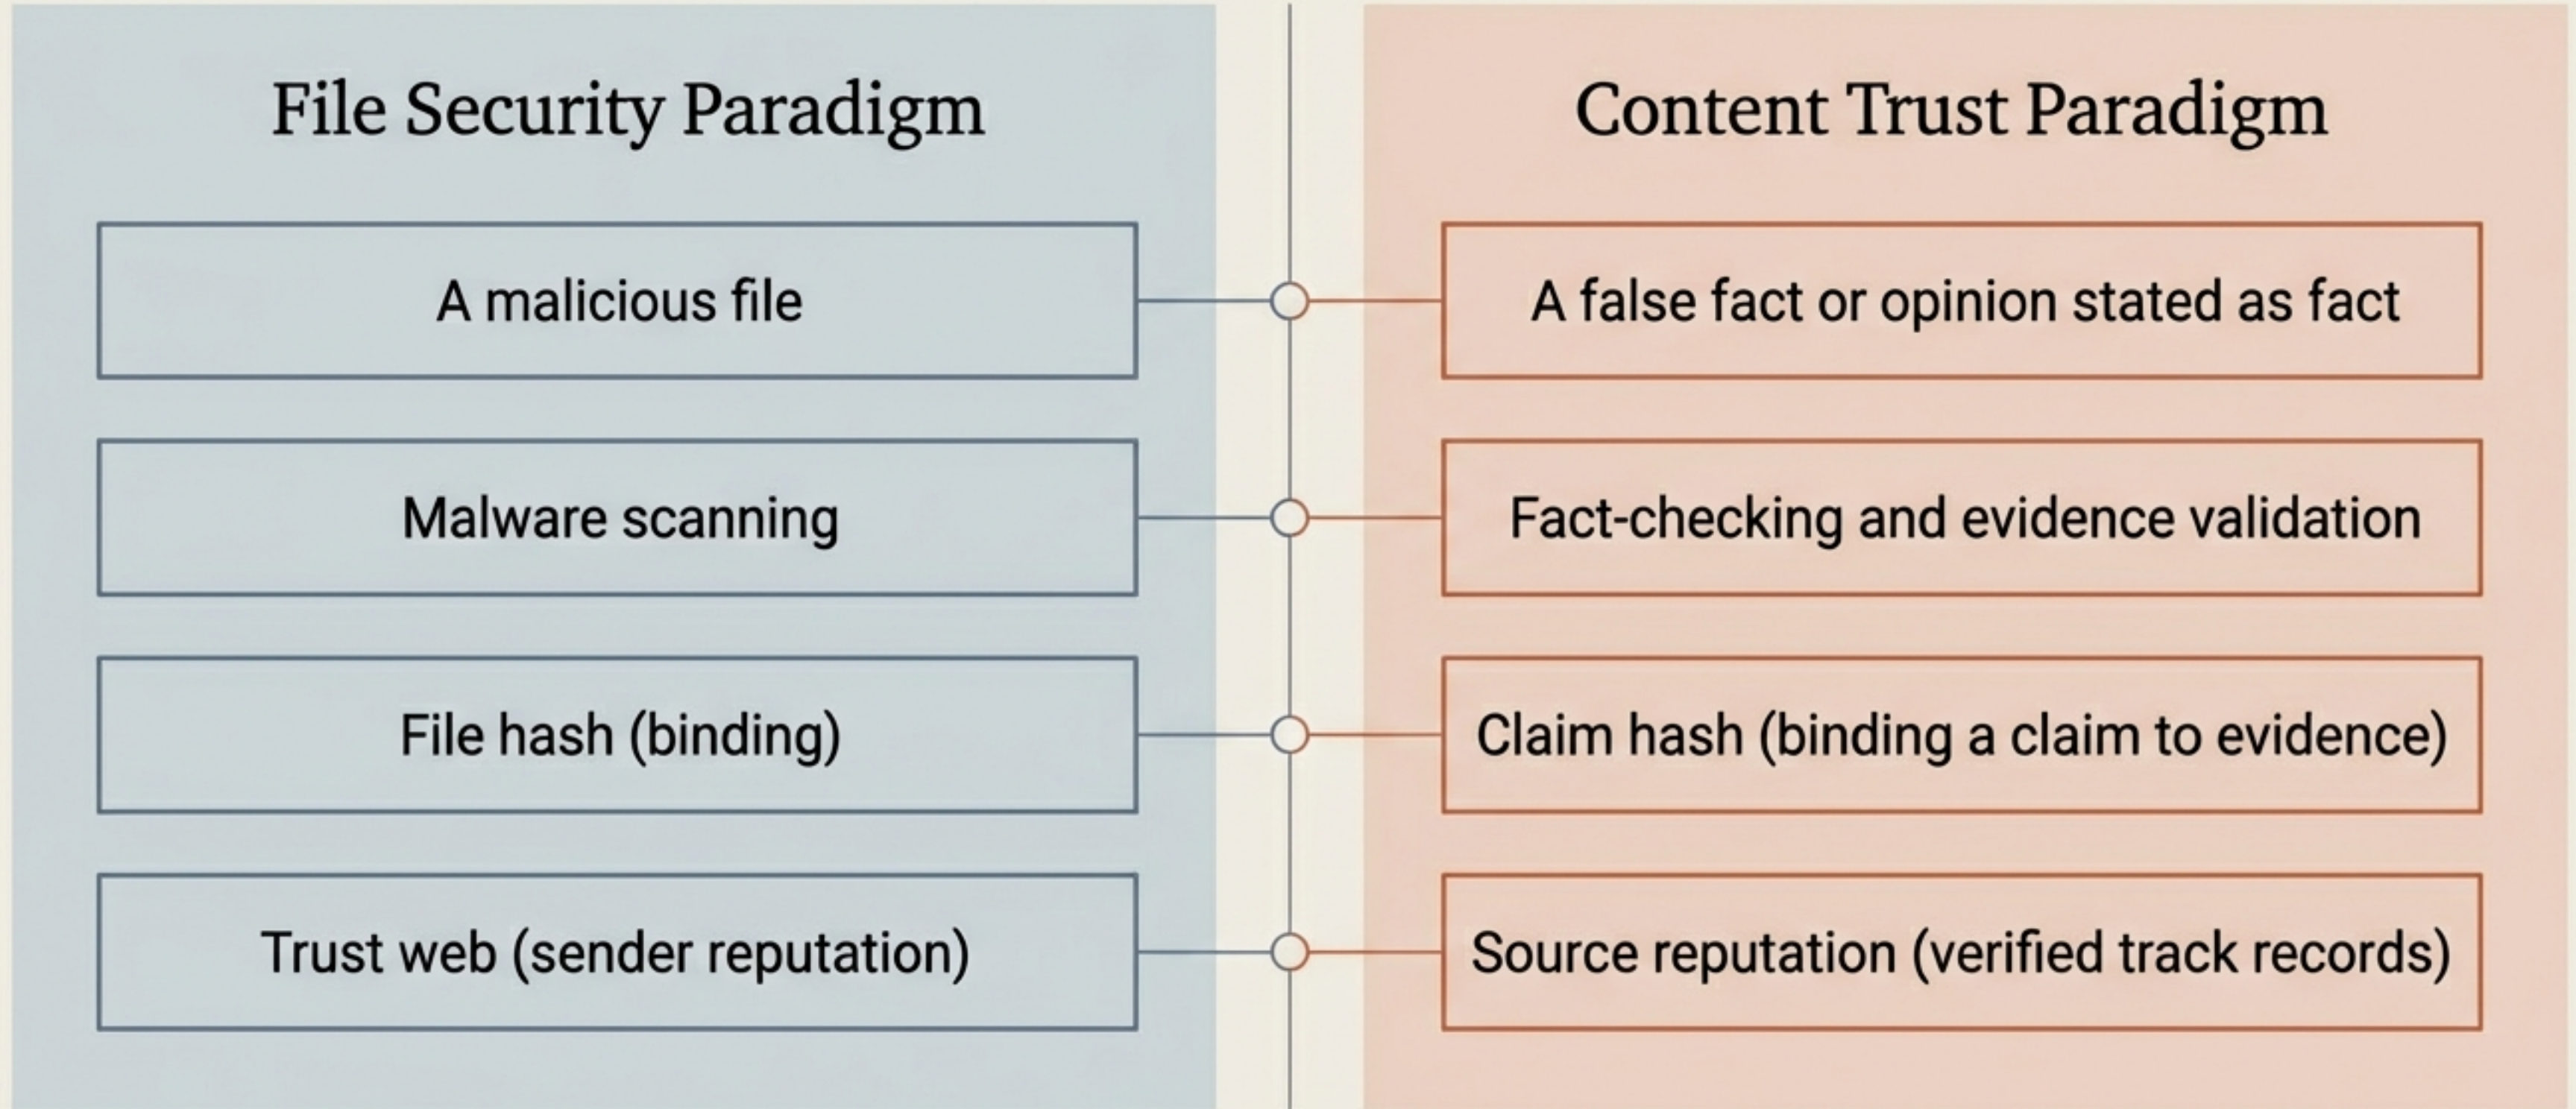

Version v0.6.14 | 23 Feb 2026 | Strategy: ILC

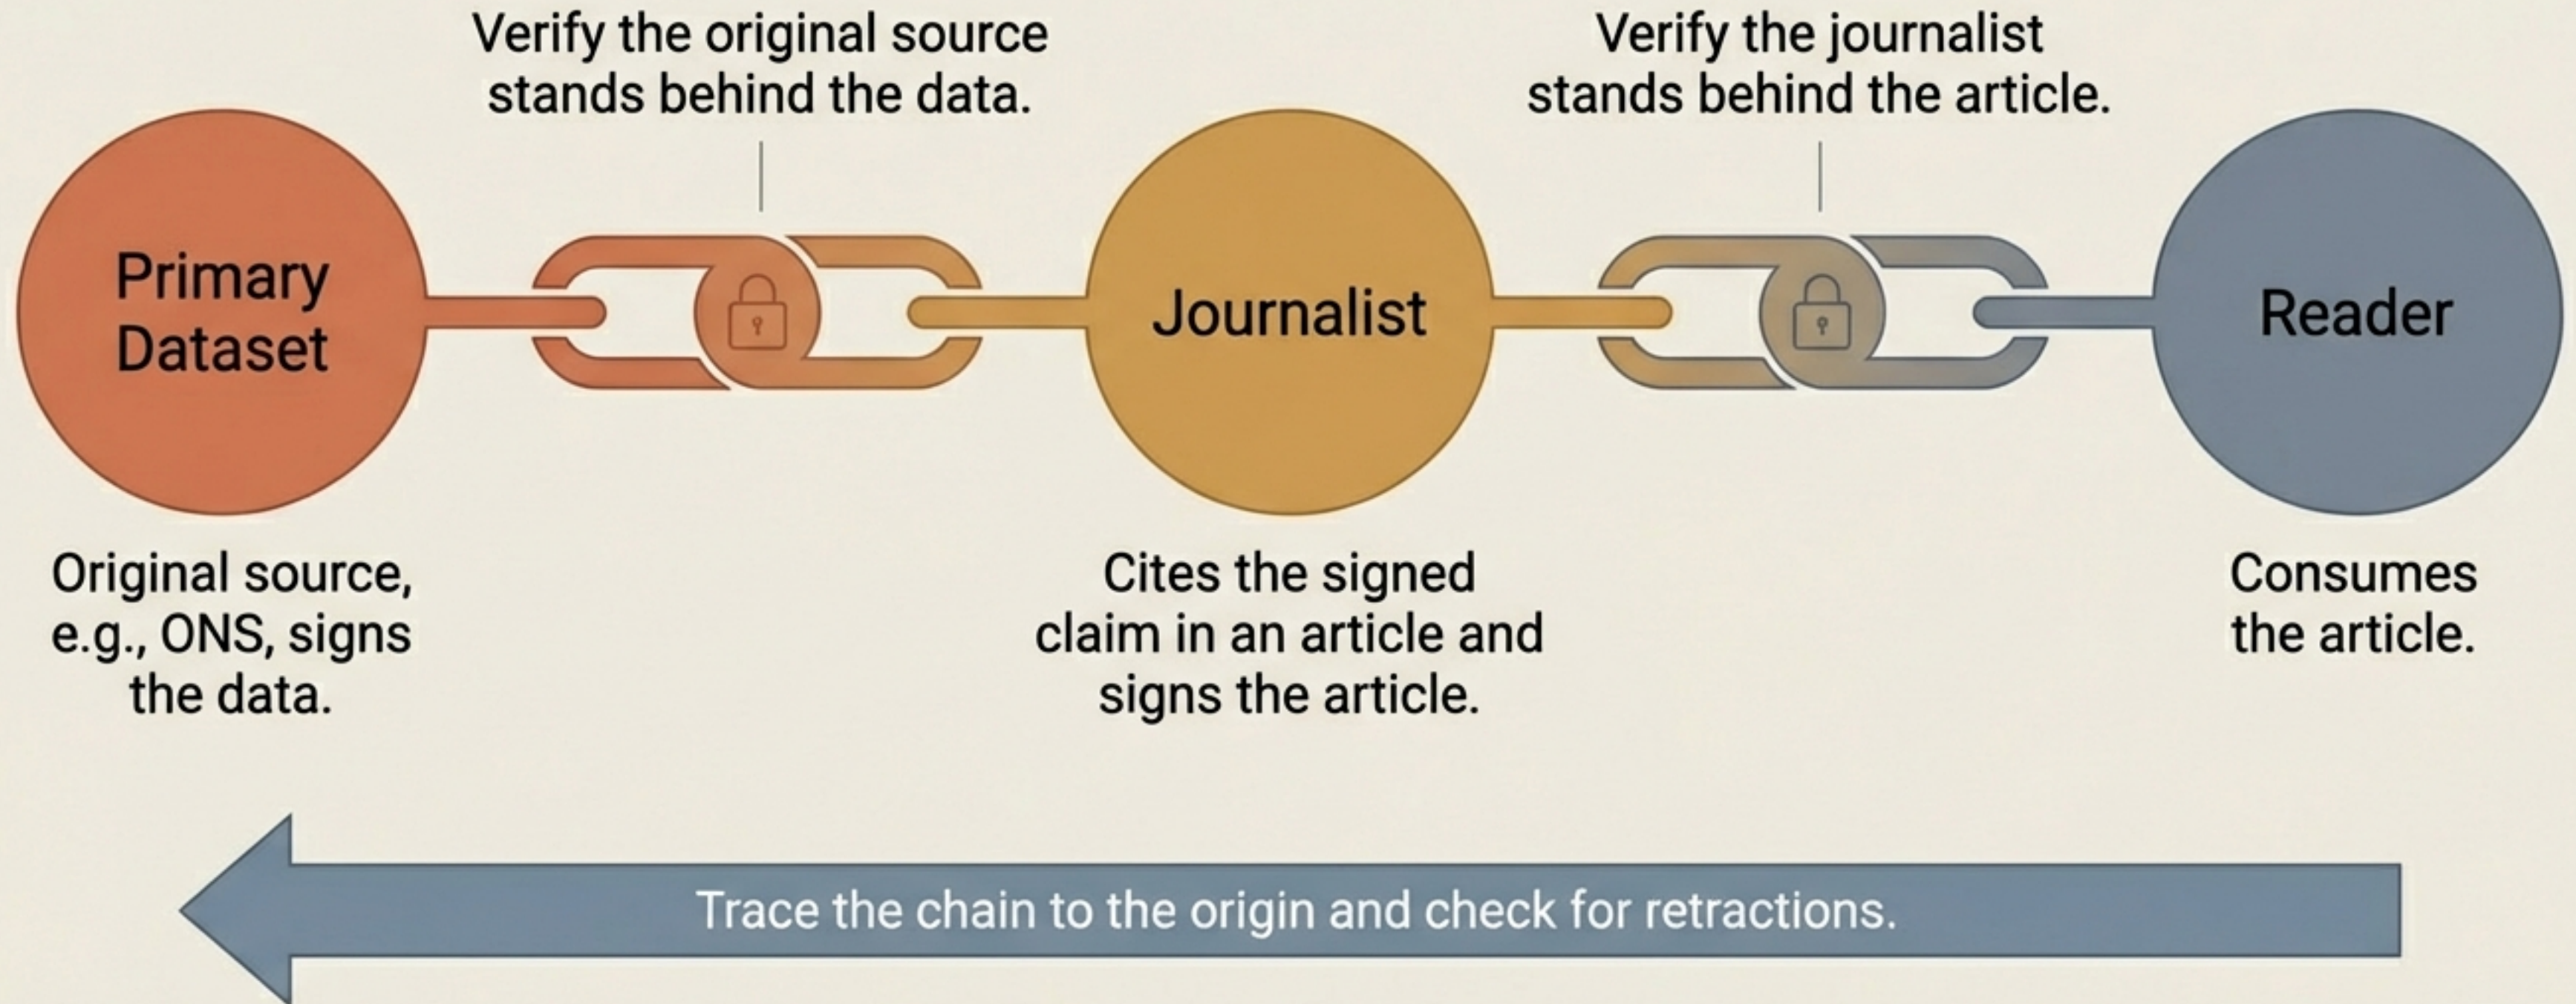

The ILC strategy commoditises security to unlock content trust

Translating the file security architecture into content trust

Cryptographic provenance chains link readers to primary sources

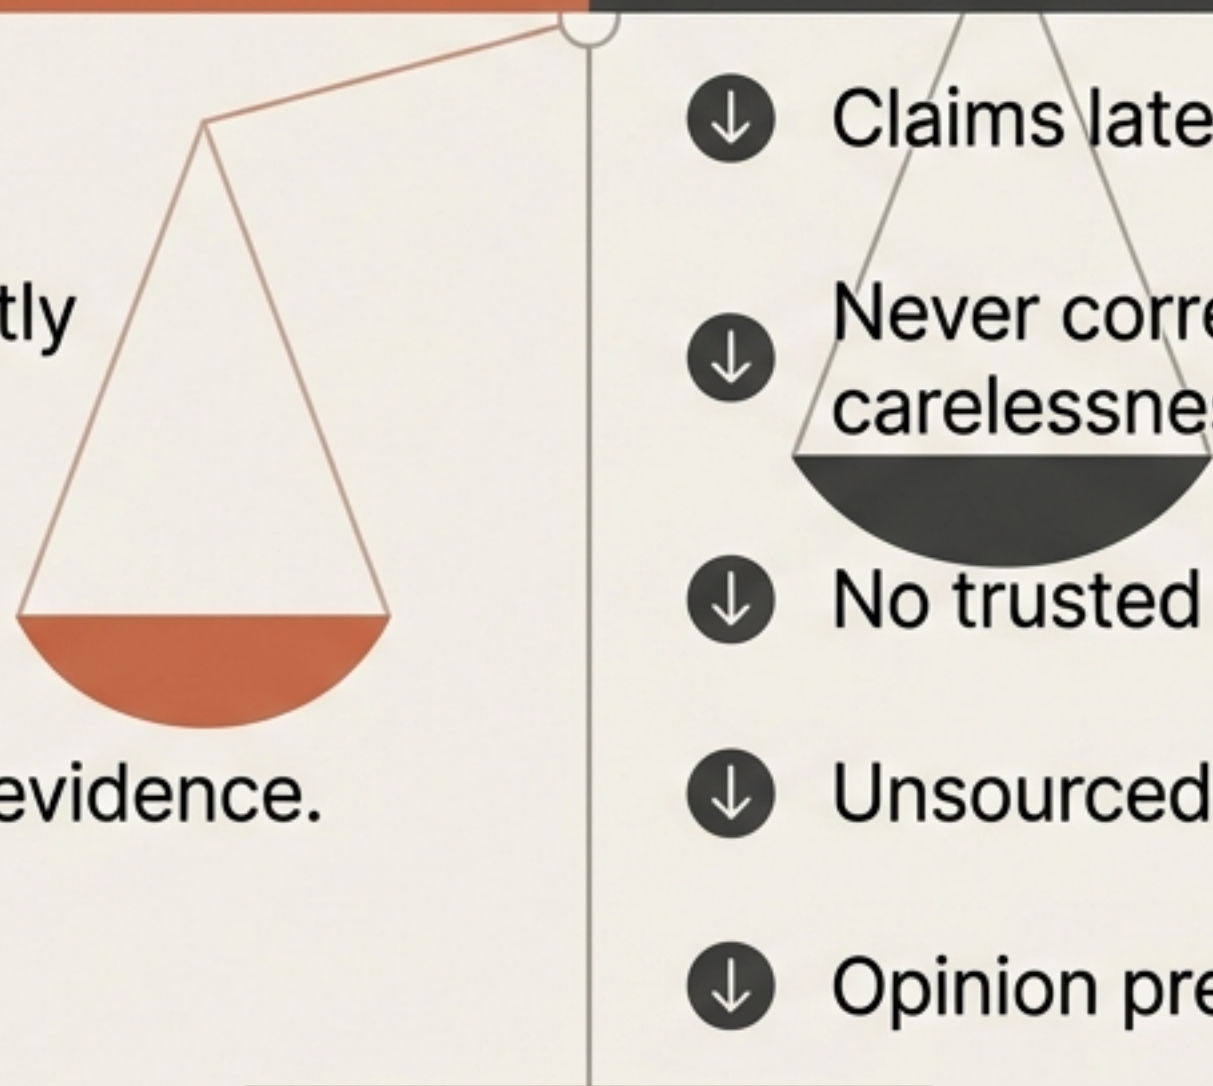

Sources build reputation through verifiable activity over time

Building Trust

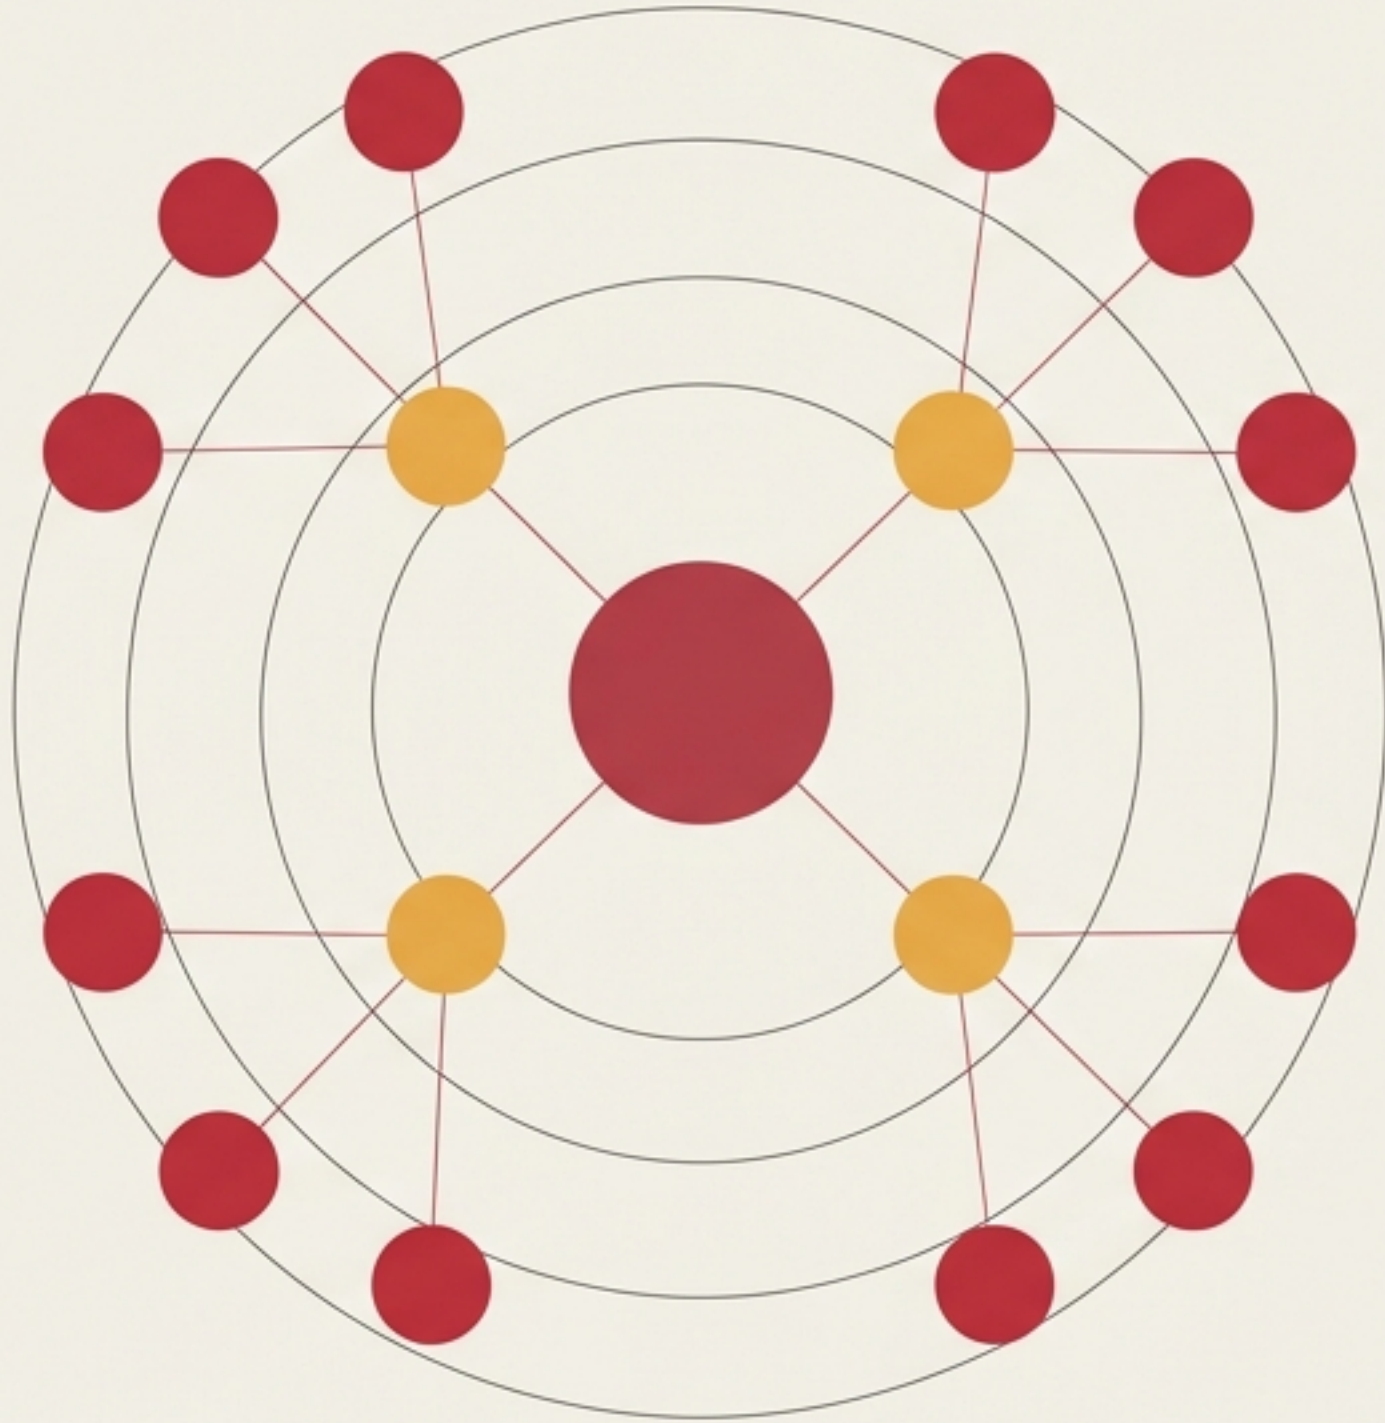

- ↑ Claims verified over time.
- ↑ Corrections issued promptly (shows integrity).
- ↑ Cited by trusted sources.
- ↑ Claims backed by signed evidence.
- ↑ Opinion clearly labelled.

Destroying Trust

- ↓ Claims later disproven.
- ↓ Never corrects errors (shows intent or carelessness).
- ↓ No trusted outlets reference the source.
- ↓ Unsourced or self-referential claims.
- ↓ Opinion presented as fact.

Retracting a root claim triggers systemic network destruction

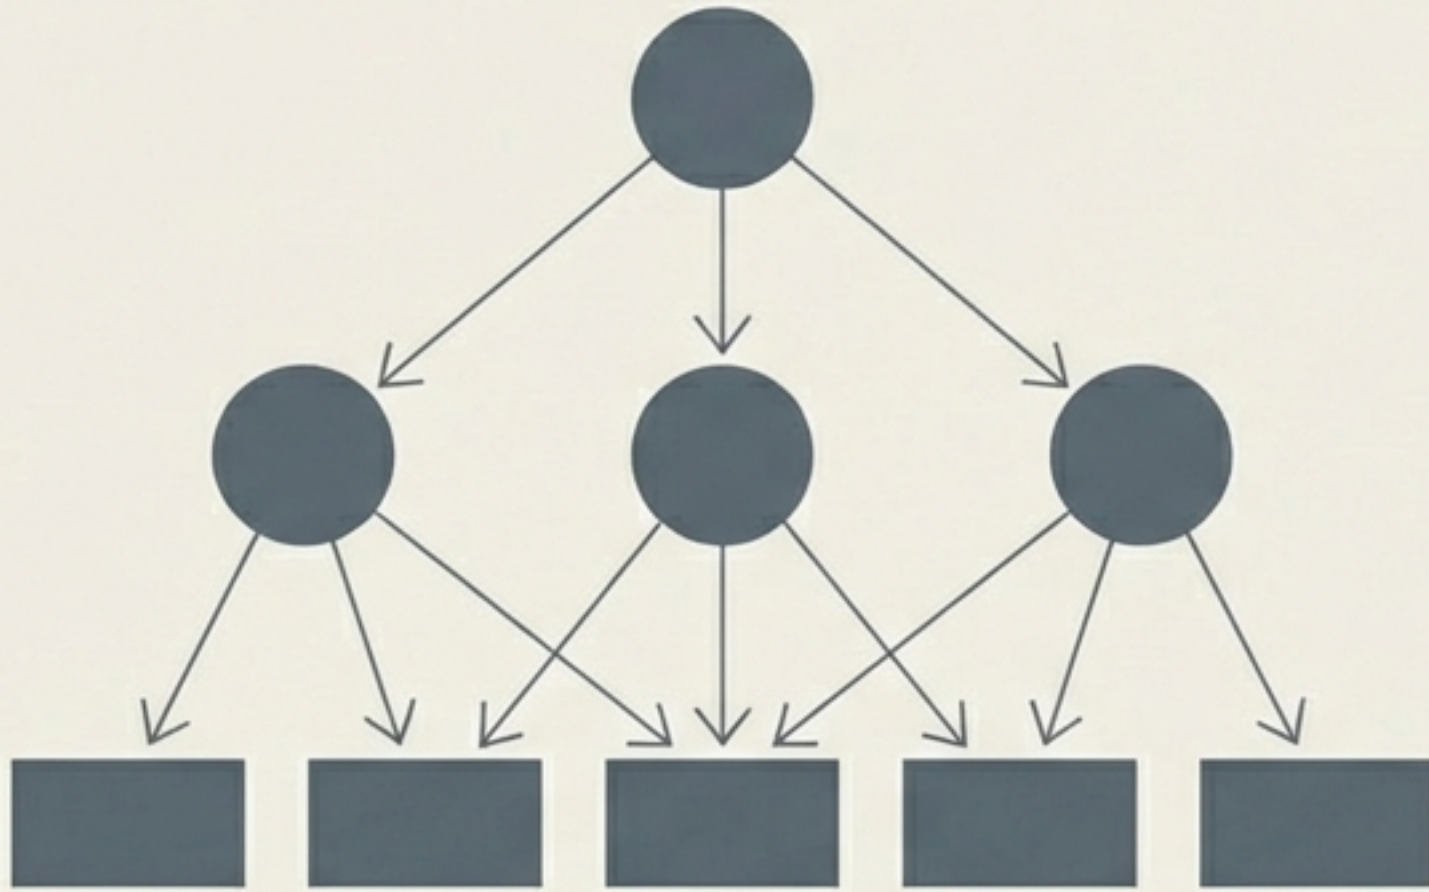

Currently, false claims propagate virally while corrections barely travel.

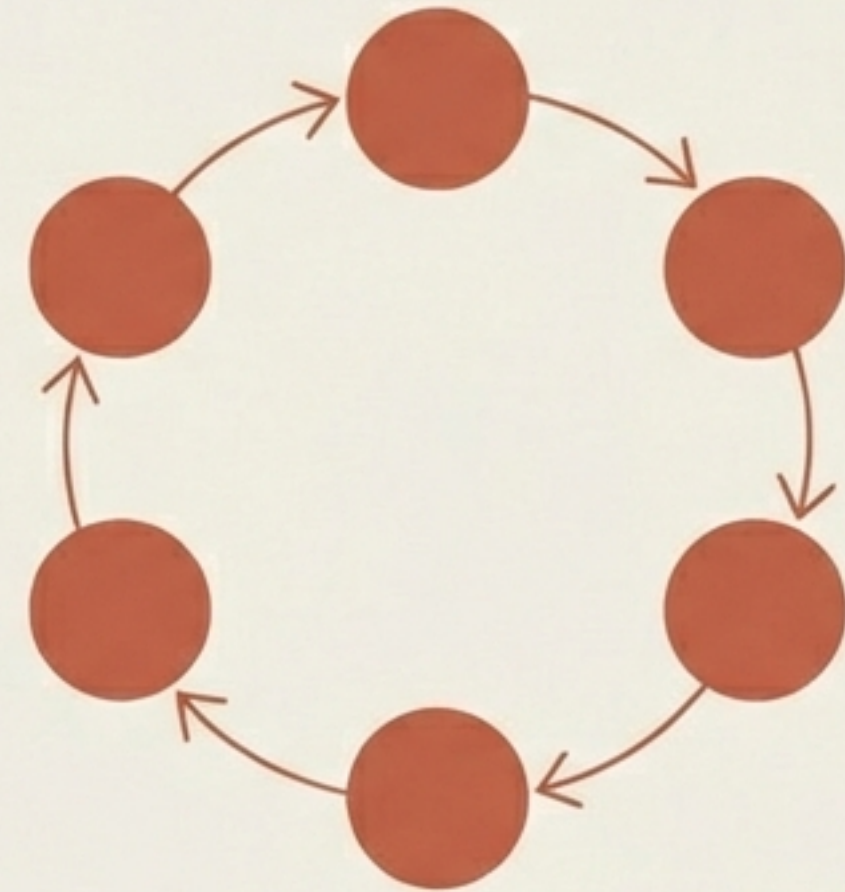

In this model, the correction propagates with the exact same force as the original claim.

Every consumer is cryptographically linked and instantly notified.

Citation graphs differentiate facts from echo chambers

Facts have evidence. They are backed by other facts, all the way down.

Opinions lack underlying evidence. Dense clusters of sources citing only each other are structurally detectable.

Measuring evidenced value rather
than subjective truth

“The system doesn’t
decide what’s **TRUE** —
it measures what’s
EVIDENCED.”

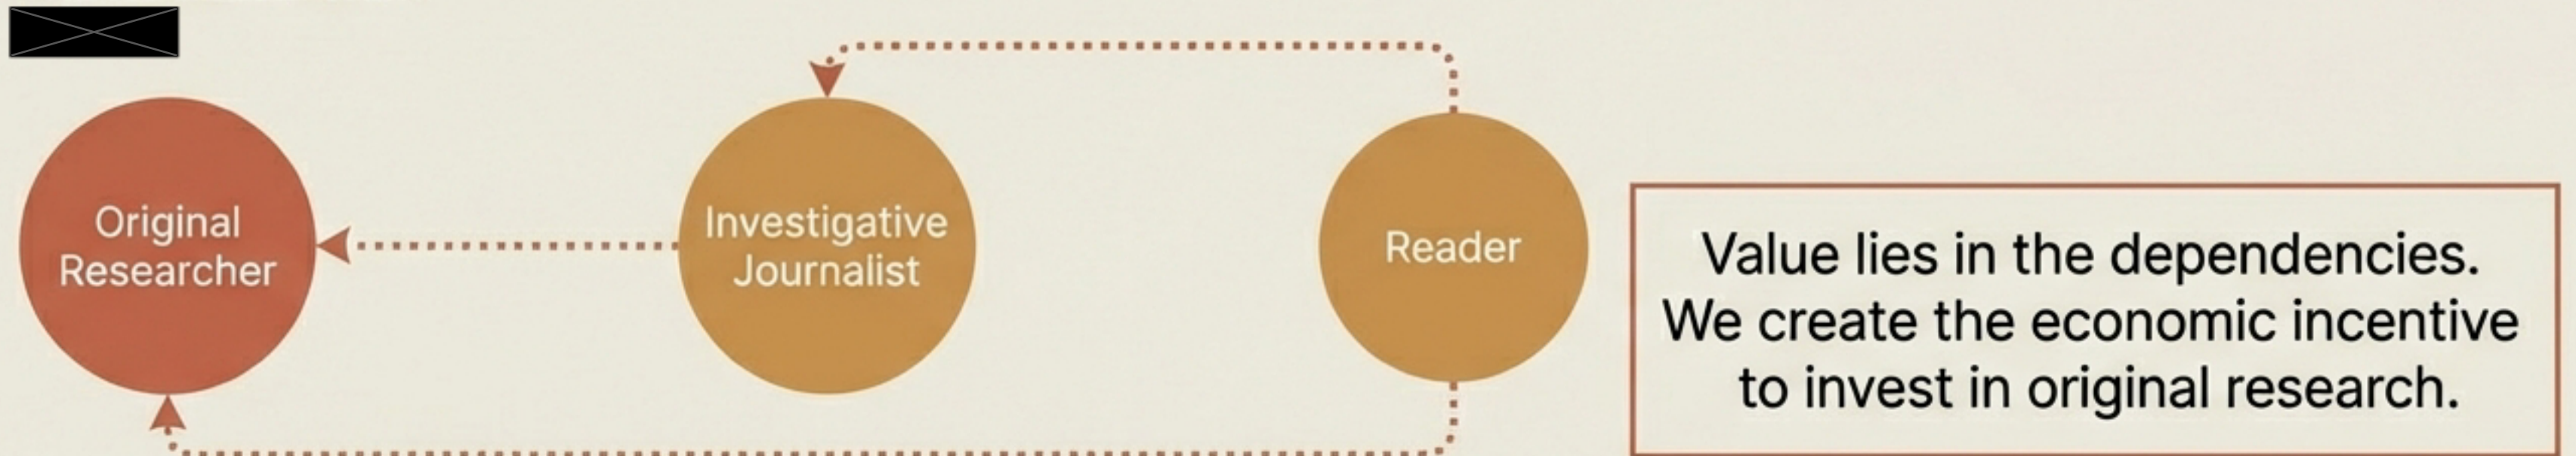

The reader sees the evidence chain and decides.
We provide the cryptographic infrastructure to make that chain visible.

Transparent provenance redirects financial flows to original creators

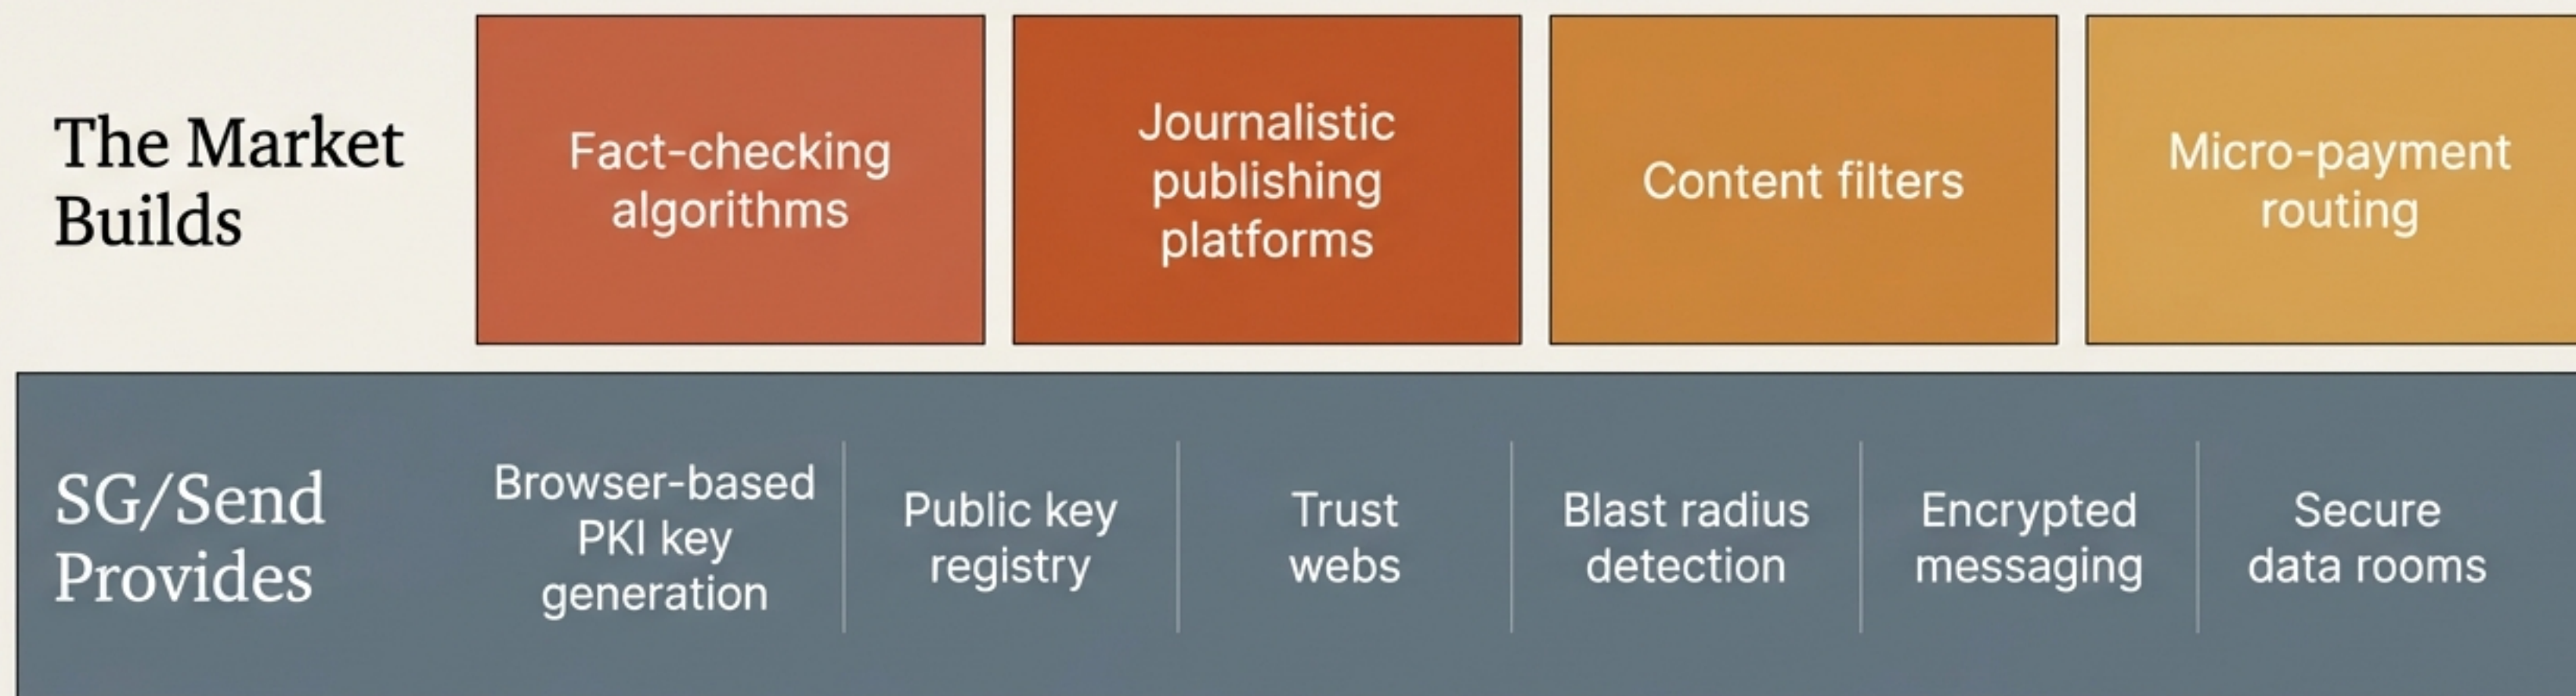

CURRENT BROKEN STATE

THE PARADIGM SHIFT

SG/Send provides the infrastructure for the market to build upon

We provide the open-source plumbing. The market builds the content trust applications, driving value back to our platform.

Content trust unifies all foundational architecture
