

Brief: GenAI Document Creation Service — From Voice to Polished Output

version v0.10.1

date 2 Mar 2026

from Human (project lead)

to Ambassador (lead), Developer, Sherpa

type Business opportunity brief — new service line

The Opportunity

As of March 2026, the ability to go from voice memos, transcripts, rough documents, and half-baked ideas to polished slide decks, infographics, notebooks, and reports has reached a tipping point. The tools exist. The models are good enough. But most people don't know about them, don't know how to use them, don't know how to prompt effectively, and don't have the time or taste to do it well.

This is the photo printing analogy: in the early days of digital photography, everyone had photos on their computer, but not everyone had the printer, the paper, the software, or the inclination to turn them into printed cards. Businesses started in bedrooms — take an order on a website, print it on a normal printer, ship it by post. The technology was commodity. The value was in the service: turning what the customer had into what the customer wanted.

The same opportunity exists now for GenAI content creation.

What the Service Does

Input: Whatever the customer has — voice memos, interview transcripts, rough documents, half-written decks, scattered notes, ideas in their head.

Output: Polished, professional materials:

- Documents and reports
- Slide decks and presentations
- Infographics
- NotebookLM-style audio briefings
- Newsletters and summaries
- Multilingual variants of any of the above

The process: A combination of human expertise (framing, questioning, taste, iteration) and GenAI tools (Claude, ChatGPT, NotebookLM, Llama, image generation, etc.) — whichever model best serves the task.

Why Now, Not Six Months Ago

Six months ago, doing this required significant manual effort and the output quality was inconsistent.

Now:

- Models produce significantly better first drafts
- NotebookLM and similar tools create compelling audio and visual outputs
- Slide deck generation is approaching "good enough for business use"
- Infographic generation is viable
- The workflow from voice → transcript → structured document → polished output is proven (this is literally what the human does every day with these memos)

The proof: This briefing process — voice memo → Otter.ai transcript → Claude analysis → structured brief — is the service in miniature. The human is already doing this daily. The question is: can other people pay for it?

Where the Human Adds Value

The service is NOT "we run your text through an LLM." Anyone can do that. The value is in what humans bring:

The art of questioning. The right questions extract the right content. A skilled interviewer gets better material from 30 minutes than an unskilled one gets from three hours. This is not a formula — it's micro-decisions about what to probe, what to skip, what to reframe.

Framing and taste. Knowing what makes a good slide deck vs. a mediocre one. Knowing when the infographic needs to be simpler. Knowing when the document needs more depth vs. more clarity. This is editorial judgment that LLMs don't have.

Brand and trust. People are buying the person, the insights, the perspective — not just the output. A document produced by a known expert carries more weight than the same document produced anonymously by an LLM.

Iteration and discovery. The most valuable phase is often not the final output — it's the process of getting there. The conversation that clarifies thinking. The draft that reveals what's missing. The feedback loop that sharpens the message. The service enables discovery, not just production.

The Multilingual Angle

This is a massive market differentiator. If people in English-speaking markets are underserved by these capabilities, non-English markets are dramatically more underserved:

- Many GenAI tools work well in multiple languages but the awareness is lower outside English-speaking communities
- A NotebookLM-style audio briefing in Portuguese or German or Japanese is striking for someone who hasn't seen it
- Multilingual output from a single input (brief me in English, deliver in five languages) is genuinely powerful
- The SG/Send multilingual infrastructure (17 variants already live) is a foundation for this

The pitch to non-English markets: "Give me 30 minutes of your time in your language. I'll give you back a polished deck, a report, and an audio briefing — in your language, at a quality level you haven't seen before."

The Phased Approach (Wardley Map Thinking)

The key insight: **build this on top of usage, not ahead of it.** Solve the right problem at the right time. Don't build the platform before validating the market.

Phase 1: Manual Service (Now)

Everything done with commodity tools that exist today:

Step	Tool	Status
Customer interview	Zoom / phone / WhatsApp voice note	Available
Transcription	Otter.ai / Whisper	Available
Document creation	Claude / ChatGPT / any LLM	Available
Slide deck	Claude + PPTX generation, or manual	Available
Infographic	Claude + design tools	Available
Audio briefing	NotebookLM	Available
Delivery	Email / SG/Send	Available
Billing	Stripe	Available

The model: Charge an hourly consulting rate or per-deliverable rate. The customer gets the output. The human does the work using off-the-shelf tools.

The key question Phase 1 answers: Will customers pay for this? At what price point? What do they actually want?

Price positioning: Don't overpromise. At £50-500 per deliverable, the quality expectation is manageable. At £20,000, it's not. Align with current LLM output quality. The models will get better — your margins improve over time without raising prices.

Phase 2: Add Technology (Storage, Website, Workflow)

Introduce SG/Send infrastructure:

- **Upload portal:** Customer uploads documents, voice memos, transcripts to a simple website
- **Secure storage:** Files stored in SG/Send vault (encrypted, auditable)
- **Multilingual:** Offer output in multiple languages from day one
- **Billing:** Consumption-based via Stripe (already wired up)

This is where SG/Send adds value beyond "person using LLMs":

- Customer data never leaves an encrypted environment
- Every edit, every version, every decision has provenance
- The vault becomes the project workspace

Phase 3: Automation

Start automating the repeatable parts:

- Auto-transcription on upload
- Auto-first-draft generation (human reviews and refines)
- Template-based slide deck generation
- Automated multilingual variants
- Customer-facing UI for reviewing and requesting revisions

The human's role shifts from "doing the work" to "reviewing and refining the work" — dramatically increasing throughput.

Phase 4: Full Platform

- Self-service for simple jobs (upload transcript → get deck)
- Human-assisted for complex jobs (strategy sessions, interview-based content)
- Custom workflows per customer
- Private vaults for corporate customers (data never leaves their environment)
- Proof of ownership, editing history, signatures at every step

The Corporate Angle

As soon as this enters the corporate world, the requirements escalate — and SG/Send's architecture becomes a competitive advantage:

Corporate Need	SG/Send Capability
Data must not leave the environment	Zero-knowledge encryption, deploy in customer's cloud
Audit trail required	Every file version, every edit tracked
Proof of ownership	Provenance chain from creation to delivery
Encrypted delivery	Core product — files encrypted in browser
Multi-language compliance	17 language variants already supported
Signature and approval workflows	Future: digital signatures on encrypted documents

The flywheel: People who use the service for personal or small-team needs discover SG/Send. When they need it for corporate work, they need the enterprise features. The service is a gateway to the platform.

The Self-Reinforcing Market

Anyone who uses these techniques becomes a future customer, because they raise the bar:

1. Executive sees a polished AI-generated deck for the first time
 2. "All our presentations should look like this"
 3. The team now needs to produce at this quality level regularly
 4. They either learn the tools themselves (hard, time-consuming) or use the service (easy, immediate)
 5. As they scale, they need their own environment → SG/Send enterprise deployment
-

Price Points and Market Segments

Segment	Deliverable	Price Range	Volume
Individual / freelancer	Single deck or report from transcript	£50-150	High volume, low margin
Small business	Monthly content package (decks, reports, social)	£300-1,000/month	Medium
Corporate team	Interview → strategy deck → multilingual variants	£500-2,000 per project	Lower volume, higher margin
Enterprise	Private vault + ongoing content creation service	£5,000+/month	Low volume, high margin, sticky

Immediate Actions

#	Action	Owner
1	Validate with 3-5 people: "If I could turn a 30-minute conversation into a polished deck, report, and audio briefing, would you pay for it? How much?"	Human
2	Create a sample portfolio: take 3 existing memos and produce the full output stack (deck + report + infographic + audio)	Ambassador + Designer
3	Set up a simple landing page or section on sgraph.ai describing the service	Developer
4	Price the first 5 jobs at cost (or free) to validate the workflow and quality expectations	Human
5	Track time spent per deliverable to establish unit economics	Accountant

Connection to Existing Briefs

Document	Connection
SG/Send Challenge (v0.10.1)	The outreach to friends can also pitch this service — "want to try?"
Translation Scaling (v0.10.1)	Multilingual output uses the same translation infrastructure
Billing Automation (v0.10.1)	Stripe consumption-based billing applies here
GenAI Evaluation Framework (v0.10.1)	This service scores well on criteria 1 (structural), 2 (unit value), and 5 (model survivability)
