

OPEN TALENT KNOWLEDGE GRAPH

A New Paradigm for Technical Recruitment

Authored by Dinis Cruz and ChatGPT Deep Research

THE CRISIS OF CREDIBILITY

Hiring is a Search for Truth in a Sea of Noise.

THE LIE FACTOR

- **37%** lie frequently.
- **55%** have lied specifically on a resume.
- **Result:** Hiring Managers face high costs and inherent scepticism.

THE PARADOX

THE GLOSSY LIE

THE IMPOSTOR

High Confidence, Low Substance.

THE HIDDEN GEM

High Skill, Undersold.

The candidates with the best presentation are often the worst in substance, while true talent is overlooked.

From Flat Files to Living Context Graphs

Hiring is a Search for Truth in a Sea of Noise.

The Old Way: Static PDF

Unstructured Data → Structured Knowledge

The New Way: Semantic Graph

A profile is not a document; it is a network of nodes and edges. We move from keyword guessing to semantic understanding. The platform acts as a broker connecting the Candidate Graph to the Job Requirement Graph, enabling deterministic queries rather than black-box guesses.

The Trust Layer: Automating Verification via API

Hiring is a Search for Truth in a Sea of Noise.

Anatomy of a Verified Node

The Hybrid Engine: AI Construction, Human Verification

Key Insight: We do not rely on AI 'black boxes' for the final match.
AI structures the data; Humans and APIs verify the truth.
Matching becomes a graph query problem.

Open Architecture & Data Sovereignty

Philosophy: The User Owns the Data.

Portability: Built on open standards (JSON Resume, W3C Verifiable Credentials). No walled gardens.

Deployment: Cloud-native. Available as SaaS or Self-Hosted Private Instances for strict data governance.

Empowering Talent: Skills Speak Louder Than Spin

- **Dynamic Profiles:** Auto-generate tailored resumes for specific roles from a single source of truth.
- **Holistic View:** Incorporates verified side projects, open source code, and community volunteering.
- **Meritocracy:** Verified skills level the playing field, helping candidates with impostor syndrome prove their worth.

The Employer Experience: Instant Certainty

Precision Search: Query the graph, don't guess keywords.

Reduced Risk: Auto-screen out fraudulent claims immediately.

Trust Signals: Fast-track candidates with high verification density.

The Ecosystem: Turning Competitors into Partners

We do not replace recruiters; we **supercharge** them. The platform serves as the white-label engine for agencies and the monetization layer for credential issuers.

Business Model: Monetising Trust

B2B Verification

Per-API call fees.
The "Credit Bureau"
model for skills. High
volume, low marginal
cost.

SaaS Subscriptions

Monthly fees for
Enterprises and
Agencies to manage
talent pools and
private instances.

Marketplace Fees

Revenue share on
third-party
assessments,
expedited verifications,
and courses.

Data Insights

Monetising
aggregated labour
market analytics.

→ Revenue streams are modular and can be stacked for compounding value.

Competitive Landscape & The Trust Moat

The Moat

- 1. **Reusability:** Unlike one-off background checks, our credentials are reusable assets.
- 2. **Network Effects:** As the graph grows, the value of verification increases.
- 3. **Openness:** Prevents vendor lock-in fears, encouraging enterprise adoption.

Roadmap to Adoption

The Future is Verified.

We are shifting the industry from
"Who marks themselves best?" to
"Who has proven competencies?"

Benefits: Speed for employers. Fairness for
candidates. Revenue for the ecosystem.

Join the open standard for trusted recruitment.

Technology Stack & Credits

Tech Stack

Database:
Graph DB (Neo4j / AWS Neptune)

Infrastructure:
Docker, Kubernetes, Cloud-Agnostic

Standards:
W3C Verifiable Credentials, JSON Resume

Security:
OIDC, OAuth2, Encryption at rest/transit
