

Role Definition: Translator

From Internal Code to Global Culture

VERSION: v0.4.3
DATE: 16 FEB 2026
TEAM: VILLAGER (EXCLUSIVELY)
REPORTS TO: CONDUCTOR

The bridge between the Explorer's English-centric experimentation and the Villager's global production reality.

The Explorer vs. The Villager

FOCUS: Experimentation, Iteration, Internal Logic.

- **LANGUAGE:** **English** default (Code comments, Agent briefs, Internal docs).
- **OUTPUT:** Does not reach users directly.

FOCUS: Production, Polish, Reliability.

- **LANGUAGE:** Native to the user (UI, Marketing, Legal, Reports).
- **OUTPUT:** The Translator exists exclusively here.

The **Explorer** team works in English. **But the product goes to the world. The Translator** is a **production concern**, ensuring that everything reaching the user—from error messages to marketing copy—**feels native, not translated**.

The Dual Mandate

The same data, the same events, the same product—but communicated differently depending on who is reading.

The Fallacy of AI Translation

AI Output

Technically correct, but robotic and stiff. Defaults to English sentence structures. Misses slang and emotional tone.

Human Nuance

Culturally resonant, native, and emotive. Captures regional expressions and correct formality levels.

Problem 1: LLMs are trained on English-centric data.

Problem 2: They conflate regional variants (pt-BR vs. pt-PT).

Problem 3: They lack a soul.

“The human reviewer is what makes the translation actually work. It is not optional.”

The Pipeline: Augment, Don't Replace

Cultural Nuance: The Tale of Two Portugueses

Context: Brazilian and European Portuguese differ in vocabulary, grammar, and formality.

Impact: A Brazilian user encountering European syntax feels alienated. It signals “this software wasn’t made for you.”

We do not translate for ‘languages’; we translate for ‘cultures.’

Technical Strategy: Finding the Right Models

The Mandate:

We identify and integrate LLMs that are natively trained in the target language. We prioritize quality and API accessibility over cost.

Dogfooding: The SG/Send Workflow

Strategic Benefits:

- ✓ • Encrypted in transit.
- ✓ • Generates real usage data for Sherpa.
- ✓ • Low friction for volunteer reviewers.

Audience Translation: One Event, Four Stories

Serve each persona, rather than a single generic document that serves none.

A Cross-Cutting Capability

Everything that reaches an audience needs translation.

Immediate Priorities (Phase 1)

Scaling the Market

Every language we add is a market we can credibly enter.

Future Phase: Corporate Identity Translation

Concept Definition

The Solution: Translation Profiles.

We combine Language + Cultural Guidelines + Brand Voice + Glossary to preserve identity.

The Evolution of the Role

Phase 3: The Product.

Revenue Generation. P&L Owner.
Client-side translation features.

Phase 2: Market Entry.

Growth Strategy.
Community-driven reviews.

Phase 1: Internal Translation.

Quality Assurance.
100% Coverage.

The Thread

Phase 1:
Builds the
Memory.

Phase 2:
Builds the
Infrastructure.

Phase 3:
Monetises the
Capability.

The Translator is where AI augmentation is most visible. The AI handles the volume. The humans handle the soul. Together, we build a global standard.
