

Secure Governance for Investment Groups

Closing the gap between sensitive deal flow and insecure communication channels.

The Reality of Daily Deal Flow

You manage multiple portfolio companies. Every day, critical data flows between you and those organisations. Speed is the currency of investment, often sacrificing security for convenience.

The 'Good Enough' Fallacy

The tools you trust with your money were not built to protect your secrets.

CLEAR TEXT

- Sent in cleartext.
- Sits in inboxes indefinitely.
- Searchable by providers.
- Forwarded without knowledge.

THE BACKUP FLAW

- End-to-end encrypted only between devices.
- Critical Loophole: Chat histories backed up to iCloud/Google Drive are unencrypted by default. Deal discussions live in a plaintext cloud. 

SERVER ACCESS

- Encrypted in transit but stored on Slack's servers.
- Administrators and Slack itself can access message content. No governance over retention.

The Governance Gap

“You get away with this because you’re the ones paying for it. But from a governance perspective, it is a liability.”

LACK OF CONTROL

Once sent via email or Slack, you lose ownership of the data.

THE PERSISTENCE RISK

Confidential deal documents sitting in personal inboxes years after a deal closes.

THE CREDENTIAL RISK

Passwords sent via DMs create a permanent keylog of access to your portfolio’s infrastructure.

Zero-Knowledge Transfer.

Immediate. Browser-Based.

SG/Send is a file and message transfer service where the server never sees your data in plaintext.

Client-Side Encryption:

Happens in browser
before data leaves.

No Installation:

Works instantly, no
deployment software.

True Privacy:

We store only
encrypted bytes.

How It Works: The Encryption Flow

The server is blind. It holds the lock, but never the key.

Two Secrets, Two Channels

Security depends on separating two pieces of information.

Secret 1: File ID / Link

What it is: The URL locating the encrypted file.

How to share: Email, Slack, WhatsApp.

Secret 2: Decryption Key

What it is: The cryptographic key to unlock content.

How to share: A DIFFERENT channel (SMS, Signal, Phone call).

Why Two Channels is Safer

Standard Email		Single point of failure (Inbox compromise).	
Standard Link Sharing		Anyone with link can access.	
SG/Send		Requires simultaneous compromise of two distinct networks (e.g. Corporate Email + Cellular Network).	

Recipient Verification: If you know only one specific person received the key (e.g. via phone call), you know that person is the only one who could have read the content.

Scenario 1: Confidential Messaging

Financial guidance, strategic direction, or sensitive personnel matters.

The Old Way

Email trails that last forever.
WhatsApp backups.

The SG/Send Way

No email trail. No history.

Scenario 2: Agile Due Diligence

Receiving financial statements, IP docs, or employee records from a target company.

Scenario 3: The Keys to the Kingdom

AWS admin access, banking portal logins, API keys, MFA seeds.

The SG/Send Way

Credentials encrypted as temporary text block.

Expiry Configuration:
Self-destruct after 1 hour or 1 view.

Result: Credentials never exist in a chat log or email archive.

PERMANENT KEYLOG
PREVENTED.

Scenario 4: Portfolio Isolation & Simple Data Rooms

Managing 15+ portfolio companies. Preventing cross-contamination.

Isolated S3 Buckets.
Secure S3 storage.

: **Encrypted** at Rest. :
: **Archivable** (Zip & Restore). :

Auditable Logs.
No data mixing.

Deployment & Ownership Models

Shared Instance send.sgraph.com	Dedicated Instance Your subdomain, our AWS	Self-Hosted Your AWS account
Best for quick, informal transfers. 	Isolation without management. 	Maximum control. Data never leaves your environment. 

Architecture

Deploys in minutes. No servers to patch.

The Cost of Peace of Mind

Comparing the financial expense to the strategic value of security.

Infrastructure: S3 storage (pennies/GB), Lambda (fractions of a cent).

Total: < \$50/month for a dedicated instance.

Governance Starts Today

- 1. Try it now: send.sgraph.com**
Send yourself an encrypted file.
- 2. Deploy:** [REDACTED]
Dedicated instance in under 1 hour.
- 3. Control:** [REDACTED]
Deploy into your own AWS account.

**No contracts. No minimum commitment.
The product works today, in your browser.**
