

The Sherpa

Guiding Users Through the Unfamiliar
Territory of SGraph Send

Powerful, But Intimidating

SGraph Send is Zero-Knowledge territory. This is not a luxury hotel; it is a mountain. Users encounter hostile concepts and unforgiving security models.

USER

CLIENT-SIDE
ENCRYPTION

SPLIT-CHANNEL
KEYS

TRANSPARENCY
PANELS

NO SERVER
RECOVERY

SGraph SEND

"The difference between 'I don't trust this' and 'I understand and trust this' is the Sherpa."

The Hand on the Shoulder

// DATA_MODEL: INTERNAL_ENTITY
// ACCESS_LEVEL: READ_ONLY

// INTERACTION_NODE: DIRECT_USER
// TASKS: GUIDE, ONBOARD, SUPPORT

Has hands in the real world.
Guides the user on the mountain. Responsibilities:
Onboarding, answering real questions, reading trails.

The Sherpa is the only role that touches the user.

Designing the First Ascent

Owning the experience from landing page to first encrypted transfer.

// ROUTE_PLAN: USER_ONBOARDING_ASCENT

// CHECKPOINTS: 4

Camp 1

Flow Design

Determining the sequence

Camp 2

The Briefing

Explaining Zero-Knowledge in plain English

Camp 3

The Equipment

Key management guidance

Camp 4

The Rescue

// VISUAL_METAPHOR: DIGITAL_TO_PHYSICAL_TRAIL

“You can learn more about the user experience from observing behaviour than from asking questions.”

The trails never lie. Logs, error rates, and pauses are footprints in the snow. The Sherpa reads what happened even when nobody was watching.

What the Trails Tell Us

Access Patterns

Time gaps between visits. When do they return?

Abandonment Points

The 'cliff edge'. If 40% drop at key management, the trail screams danger.

Time-Between-Steps

Long pause = reading carefully or frozen in confusion? The next step reveals which.

Retry Behaviour

5 retries = motivated but blocked.
1 retry = frustration.

Attacker Trails

If the system confuses attackers, it's secure.
If it confuses everyone, it's a UX failure.

Documenting the Struggle

Friction Log

WHO:	Persona Type A (Non-Technical)
WHERE:	Key Generation Screen
WHAT:	Expectation vs Reality
RESOLUTION	Abandoned flow

Advocate
(Argues for needs)

Designer
(Iterates flows)

Dev
(Prioritises fixes)

Converting “user had a problem” into structured data.

Watching the Terrain Shift

When Dev ships code, the trails change. The Sherpa monitors abandonment spikes and new error patterns. The Cartographer maps blast radius through code; the Sherpa maps it through user behaviour.

Preparing the Climber

Sherpa's Kit

Explains "Why",
not just "What".

UI Tooltip box

Contextual
recovery steps.

Error Message box

Bearer Token card

- Managing the beta list.
- Distributing bearer tokens.
- Guiding friendly users through the first loop.

The Recipient's Journey

The Post-Climb Debrief

Where the Work Lives

Correcting the Metaphor

The Concierge

Makes you comfortable.
Operates in luxury.
Wrong environment.

The Envoy

Represents the
company TO the user.
Wrong direction of
loyalty.

The Sherpa

Makes you **capable**.
Walks **WITH** the user.
Ensures survival and
success.

Collaborating on the Route (Builders)

The Advocate

Argues for the user in the room. **Sherpa** provides the ground truth.

The Designer

Creates the UI. **Sherpa** validates it against trail data.

Dev

Receives specific **friction points**. "Users abandon here because X".

DevOps

Sherpa demands "User Behaviour" telemetry, not just "System Uptime".

Security & Growth

AppSec / CISO

Sherpa reads attacker trails to judge UX legibility.
If attackers are confused, are users confused?

The Ambassador

Sherpa owns the “sticky” experience that makes growth strategies work.

The Architect

Sherpa flags when architecture creates complexity (e.g., expiration without countdowns).

Why 'Sherpa'?

Guide personally. Know the terrain.
Adjust the pace. Ensure safety.

**The concierge makes you comfortable;
the sherpa makes you capable.**
