

The Internet, Filtered by Intent.

A platform that allows you to visit any website and see only the content that matters to you—same URL, same design, intelligently filtered.

We fix the noise without changing how you browse.

The Core Promise: Visit any website through our proxy. The design stays intact, the URL remains the same, but you see only the content that matches your specific intent.

No App to Install

Configure browser once.

No New UI to Learn

Original design remains.

No Code Changes

Change the natural language prompt.

Five distinct problems solved by a single architecture.

The only difference between these use cases is the classification prompt.

Code	Use Case	Target Audience	Core Value
UC-01 CLARITY	Content Quality Filter	Knowledge Workers	See substance, hide fluff
UC-02 STACKLENS	Technology Stack Filter	Engineering Teams	See your stack, hide the rest
UC-03 ALTITUDE	Technical vs Business	Mixed Audiences	The right depth for your role
UC-04 SENTINEL	Security & Compliance	Security Teams	Never miss what matters
UC-05 ORIGIN	New Features Only	Frequent Readers	Skip the roundups

UC-01 CLARITY: Extracting substance from the noise.

THE PAIN (Content Quality Issue)

Content-heavy sites mix genuinely valuable material with promotional noise. Every visit requires “mental triage” to find the actual insight.

Target Audience: Knowledge Workers

THE FILTERED REALITY

The Clarity Experience: The user sees a clean page containing only high-value information. The layout preserves the site's integrity but removes low-signal blocks.

Strategy: Classify blocks based on 'Quality' and 'Substance'.

UC-02 STACKLENS: Engineering updates tailored to your specific stack

THE PAIN (The Relevance Gap)

AWS and other providers announce dozens of services daily. Stack as. For a team using only **EC2** and **S3**, updates about “**Quantum Ledger Database**” are **distraction**.

THE FILTERED REALITY

The **StackLens View**: An engineer visits the AWS “What’s New” page and sees only updates relevant to their defined tech stack.

Strategy: Match content against a specific list of technologies in the prompt.

UC-03 ALTITUDE: Calibrating content depth for the viewer's role.

THE PAIN (The Depth Mismatch)

Technical blogs often mix deep code snippets with high-level executive summaries.

A CTO needs the summary; a Developer needs the code.

THE FILTERED REALITY

Two Profiles, Same Source.

- **Profile A (Executive):** Sees business impact and summary.
- **Profile B (Technical):** Sees implementation details and code.

Strategy: Two templates, deploy as separate profiles.

UC-04 SENTINEL: Ensuring security teams never miss a signal.

THE PAIN (Signal-to-Noise Risk)

Security teams have a mandate to never miss relevant updates, but they are drowning in general tech news. The fear of missing a zero-day alert is constant.

THE FILTERED REALITY

The Sentinel View: A curated stream where non-security news is aggressively filtered out, leaving only vulnerabilities, patches, and compliance updates.

UC-05 ORIGIN: Bypassing the echo chamber of recycled content.

THE PAIN (Content Lifecycle Problem)

Blogs republish content in multiple formats:

Original → Weekly Roundup →
→ Monthly Recap → Year-End
Summary

Frequent readers waste time re-reading
the same news.

THE FILTERED REALITY

The Origin View: The filter detects “Summary” or “Recap” patterns and hides them, showing only original feature announcements.

Value Proposition: Skip the roundups.

Intelligence at the speed of static HTML.

Zero-latency architecture via out-of-band processing

Key Insight: The LLM does not sit in the user's request path. We serve pre-processed, cached variants.

Why this architecture works at scale.

LATENCY		COST	
	Solution: LLM runs out-of-band. Request-time is merely an S3 fetch (~70ms). 		Solution: LLM costs are amortised over daily/scheduled runs, not incurred per user request. Daily Runs → 
RELIABILITY		CONSISTENCY	
	Solution: If the LLM fails, the system serves the last-known-good cached version. 		Solution: The same classification is shown to all users until the next scheduled refresh. 

Implementation Status: Ready Now.

UC-01 CLARITY

✓ IMPLEMENTED & TESTED

Demo ready.

UC-02 STACKLENS

📄 TEMPLATE READY

Needs customisation per customer stack.

UC-03 ALTITUDE

📄 TEMPLATES READY

Deploy as separate profiles.

UC-04 SENTINEL

📄 TEMPLATE READY

UC-05 ORIGIN

📄 TEMPLATE READY

Takeaway: The platform is built. The templates are written. We are ready to deploy.

Deployment Checklist: From Idea to Demo

The framework is live. Choose your filter.

We have proven the architecture with Clarity (UC-01).

We have templates ready for StackLens, Altitude, Sentinel, and Origin.

The noise is optional.
