

Content Filtering Platform: Tier 2 Capabilities

The Power of Prompt-Based Flexibility

One Platform, Infinite Lenses.

Tier 2 represents high-impact product expansion with **zero** engineering lift.

The Constraint	The Asset	The Result
Zero code changes required. The engineering effort is strictly limited to prompt engineering.	Classification system and serving infrastructure are already active.	Four distinct new products ready for immediate deployment.

The Chameleon Engine: Same Infrastructure, Different Skins

Shared Architecture

Tier 2 uses the identical infrastructure as Tier 1.

The Mechanism

The classification system is running; the caching is deployed. The only variable is the instruction set sent to the LLM.

Efficiency

We maximize the ROI of the existing stack by changing the definition of "Value," not the code.

Four Ways to Filter the Noise

Portfolio Overview

CALM (UC-06)

The Mental Wellness Filter

For stress-conscious readers.
Filters alarmism.
“Stay informed, stay sane.”

LEARN (UC-07)

The Tutorial Focus

For developers and learners.
Extracts tutorials.
“Turn blogs into courses.”

Write Prompt → Test → Deploy

COSTWATCH (UC-08)

The FinOps Monitor

For FinOps teams. Tracks billing updates.
“Never miss a pricing change.”

SIGNAL (UC-09)

The Vendor-Neutral Filter

For engineers. Strips marketing fluff.
“Knowledge without the pitch.”

The Mental Wellness Filter

Stress-conscious readers

The Noise (Problem)

Research shows negative news exposure correlates with worse mental health. News sites lead with alarmist rhetoric to drive engagement.

The Signal (Value)

Filters out hostility and alarmism while keeping the facts. The only B2C-focused use case.

The Experience

Before: Doomscrolling through clickbait and panic-inducing headlines.

After: A sanitised feed of factual updates.

The Tutorial & Learning Focus

Developers and Technical Learners

The Noise (Problem)

Technical blogs often mix valuable tutorials with marketing fluff, life updates, and corporate announcements.

The Signal (Value)

Extracts hands-on tutorials and code. Effectively turns a messy blog into a structured course.

The Experience

Before: Wading through 2,000 words of backstory to find a code snippet.

After: Immediate access to the 'How-to' steps.

The FinOps Cost Monitor

FinOps Teams & IT Managers

The Noise (Problem)

Critical pricing changes and billing updates are often buried inside general product announcements or release notes.

The Signal (Value)

Laser focus on pricing, billing, and cost-related content. Risk mitigation.

The Experience

Before: Missing a price hike because it was hidden in paragraph four.

After: A dedicated feed for financial risk mitigation.

The Vendor-Neutral Filter

Engineers & Consultants

The Noise (Problem)

Vendor blogs frequently disguise product marketing as objective technical advice.

The Signal (Value)

Strips the sales pitch, retaining only the engineering principles and architectural facts.

The Experience

Before: Reading a 'Best Practices' guide that is actually an ad.

After: Objective technical knowledge retention.

How We Talk to the Engine

Changing the Intent, Not the Code.

CALM DIRECTIVE

> Detect and exclude hostility, alarmism, or emotional manipulation.

LEARN DIRECTIVE

> Detect instructional steps, code blocks, and educational sequencing.

COSTWATCH DIRECTIVE

> Detect monetary figures, billing entities, and pricing adjustments.

SIGNAL DIRECTIVE

> Detect subjective marketing claims and sales rhetoric; exclude them.

The engine is capable of all these views simultaneously; it simply needs the right question.

From Concept to Demo

	Status	Next Step
CALM	 Ready	Test on news site
LEARN	 Ready	Test on tech blog
COSTWATCH	 Ready	Test on AWS blog
SIGNAL	 Ready	Test on vendor blog

The Action Plan (Demo Generation)

Maximum Value, Minimum Friction

We have successfully moved from a single-use tool to a multi-vertical platform structure without incurring technical debt.

Call to Action: Begin testing phase immediately.

Write Prompt → Test → Deploy
