

Criteria-Filtered Web Browsing: An Intelligent Proxy MVP

Moving from Information Overload to Intelligent Signal Extraction

A technical specification for an intent-based filtering system that preserves design while removing cognitive tax.

The 8:47 AM Problem: Cognitive Tax in Real Time

You open the AWS News Blog to catch up.

The reality? You spend 3 minutes scanning to find 2 articles worth reading. The other 17 are noise.

The problem isn't **"too much internet."**
It is **the cognitive effort required to extract signal from noise.**

What If the Page Already Knew Your Intent?

Same URL. Same visual design. Distinct Intent.

Standard View

Intent: Technical Deep Dive

Technical Deep-Dive: Show specs, hide marketing.

Positive Engagement: Show engaging stories, hide dry updates.

Stack Relevance: Show "Serverless", hide "Databases".

Beyond Sentiment: Filtering for Quality and Relevance

Sentiment Analysis

Card A

**AWS Lambda supports
10GB memory.**

Positive Sentiment (High Utility)

Card B

**Unlock the power of cloud-
native transformation.**

Positive Sentiment (Low Utility/Fluff)

Traditional
Sentiment
Analysis sees
both as
POSITIVE.

Content Quality

Card A

**AWS Lambda supports
10GB memory.**

Actionable Technical Update

Card B

**Unlock the power of cloud-
native transformation.**

Marketing / Abstract

We do not filter based on happy vs. sad. We filter based on density vs. fluff. An LLM-based classifier distinguishes between a useful technical update and a marketing slogan, even if both are “positive”.

Defining the Lens: User Stories and Intents

The Cloud Architect

Goal: Needs actionable tech.
No marketing fluff.

Filter

Hide: Abstract platform descriptions.

Show: Deep dives.

The Team Lead

Goal: Needs shareable tutorials
for the team.

Filter

Hide: Dry release notes.

Show: Tutorials & Guides.

The Wellness Seeker

Goal: Needs to manage
corporate anxiety.

Filter

Hide: Promotional urgency.

Show: Substantive updates.

Core Need: To visit usual URLs and see a page that looks identical
but contains only items matching specific criteria.

The Barrier to Adoption is a Trust Deficit

Traditional Filtering

The Solution

Users cannot be asked to trust an AI algorithm blindly. If a user can't verify what they are missing, they will disable the tool. Trust must be earned through transparency and reversibility.

The Progressive Trust Ladder: Verification

MAIN (Original)

Step 1 of 6

Verifying Interception.

XXX (Modification)

Step 2 of 6

Verifying Modification Capability.

GROUPS (Classification)

Step 3 of 6

Verifying Classification Logic.

The Progressive Trust Ladder: Execution

REDACT (Masking)

Step 4 of 6

Seeing WHAT is targeted.

HIDE (Volume)

Step 5 of 6

Seeing the VOLUME of removal.

CLEAN (The Result)

Step 6 of 6

The Final Signal.

By the time the user reaches CLEAN, they have verified the AI's logic at every step.

Architecture: The Transparent Proxy Layer

Security

Trust Boundary Expansion:
Requires installing a CA
Certificate.

Managed via Enterprise
MDM.

Solving Latency: The Out-of-Band Processing Model

Real-Time		Out-of-Band	
2-5s latency		~70ms latency	
High Cost		Amortized Cost	
Blocking		Instant	

Key Takeaway: Users hit a pre-computed cache. The browsing flow is never blocked by the AI.

Scalability: Logic Defined by Natural Language

System Prompt
Filter out marketing fluff with active, marketing protept & auration that helps ' pricing & anid or nntve cost content.

Mental
Wellness

Prompt: Filter urgency & corporate anxiety.

Tech
Focus

Prompt: Filter non-technical marketing.

Cost
Management

Prompt: Show only pricing & cost content.

Zero Code Changes. Changing the product 'lens' only requires updating the English prompt reference.

Risks, Mitigations, and Guardrails

The Filter Bubble

⚠ Risk

Narrowing viewpoints.

✓ Mitigation

Reversibility (**Toggle to Main**),
Transparency (**Groups mode**),
and **Diversity Guardrails**.

TLS Security

⚠ Risk

Expanding trust boundary with
CA Cert.

✓ Mitigation

Strict Enterprise controls (**MDM**),
Certificate pinning, and **NIST**
alignment.

Measuring Success

User Experience

Time to Relevant Content: < 30s

(Down from 3 mins)

Articles Scanned: < 5

(Down from 19)

Technical Performance

Classification Accuracy: > 85%

(Based on validation set)

Cache Hit Rate: > 95%

(Improved efficiency)

Financial Viability

Cost Per Day: < \$0.05

(Amortized via Caching)

Market Positioning: Why This is Different

	Primary Goal	Method	Outcome
Secure Web Gateways	Block Malware	Binary Block	Safe but Noisy
RSS Readers	Curation	Strip UI	Loss of Context
Browser Extensions			
<u>Intelligent Proxy (This Product)</u>	Signal Extraction	Content Quality Filter	<u>Original Design, Zero Noise</u>

**The only tool that preserves the URL and layout,
while respecting the user’s cognitive load.**

Conclusion: Trust is the Interface

We are solving information overload by filtering for intent, not just URL. The “Progressive Trust Ladder” ensures that AI curation is an assistant the user controls, not a censor they fear.

Call to Action

1. **Review Repositories:** Mitmproxy / Cache / HTML Graph
2. **Deploy MVP:** MGraph-AI Service
