

THE LIBRARIAN ROLE

Connectivity as Curation

The Graph-Native Engine of the Issues-FS Ecosystem

Source: issues-fs__librarian-role v1.0

The Producer of Edges

In a system where meaning is proportional to connectivity, the role that creates connections creates meaning.

The Insight:

The Librarian is the most “graph-native” role. Their primary **output is not the document** (node), but the connectivity between nodes—mappings, cross-references, and anchor links. This is not support; it is the function that makes the ecosystem legible.

Learning from Library Science

Applying centuries of knowledge organization to modern graph theory.

“A node without edges is an uncatalogued book on an unmarked shelf — it exists, but nobody can find it.”

The Insight:

The core principles of library science—cataloguing, classification, and connectivity—are directly translatable to effective graph data management. The Librarian’s deep understanding of structure and relationships is the essential expertise needed to turn raw nodes into a legible, interconnect, and meaningful knowledge graph.

The Internal Ontology

To operate effectively, the Librarian internalises the thinking patterns of library science. Internally, it 'geeks out' on these terms; externally, it speaks Issues-FS.

The Most Connected Node

Success is measured in graph density, not document count.

Edges Created:

Connecting nodes that previously had none.

Edges Validated:

Confirming accuracy of connections.

Gaps Surfaced:

Identifying nodes with low connectivity.

Conflicts Surfaced:

Resolving definitions across scopes.

The Insight:

The core principles of library science—cataloguing, classification, and connectivity—are directly translatable to effective graph data management.

The Librarian's deep understanding of structure and relationships is the essential expertise needed to turn raw nodes into a legible, interconnect, and meaningful knowledge graph.

Core Graph Operations

1. Accession

Creating the initial subgraph for new inputs.

2. Cataloguing

Enriching nodes with anchors and provenance.

3. Weeding

Marking nodes as "superseded_by".

4. Authority Control

Linking "variant_of" concepts across scopes.

5. Finding Aid

Building entry points for complex topics.

Solving the Abstraction Problem

“The ecosystem grows faster than any agent can consume. Attention is expensive.”

Filtering

The Map

Task-42

ADR-7

Test Plan

The Solutions:

- **Reference:** Knowing the path, not holding the data.
- **Relevance:** Weeding out historical layers to surface the 'Active'.
- **Versioning:** Draft → Active → Superseded → Archived.

The Quality Gatekeeper

Structural review over stylistic editing. Ensuring the artifact fits the graph.

Review Checklist

- ☒ **Coherence:** Does the document make internal sense? 
- ☒ **Consistency:** Does it respect the Lexicon? 
- ☒ **Connectivity:** Is it an island, or linked? 
- ☒ **Currency:** Does it reference live decisions? 

Philosophy: Enrichment, not enforcement.
The Librarian surfaces gaps but does not block work.

From Chaos to Order: Draft Processing

The Graph Footprint: Technical Specs

The specific nodes and links owned by the Librarian role.

Node Types Owned

- **Finding Aid:** Entry point for a topic.
- **Authority Record:** Links variant names.
- **Version Node:** Point-in-time state.
- **Health Finding:** Observation about graph gaps.

Link Types Maintained

catalogued_as (Node → Lexicon Anchor)

cross_references (Bidirectional)

supersedes (v2 → v1)

variant_of ("Spike" → "Exploration")

stale_reference (Flagging outdated links)

Ecosystem Integration

The Librarian is a service role. It makes every other role's work legible.

Bootstrapping the Role

Practical implementation steps to activate the Librarian.

1

Index

Create a finding aid of all current documents.

3

Authority Records

Establish consistent terminology.
find isolated nodes.

2

Baseline Scan

Run connectivity analysis to find isolated nodes.

4

Lifecycle Metadata

Tag docs as Draft, Active, or Archived.

Tooling: Utilise MGraph-DB analysis tools for coverage and conflict detection.

The Light in the Library

The Librarian ensures Issues-FS is a library, not just a file system. It transforms a collection of files into a navigable, intelligent web.
