Beyond Encryption

The new competitive blueprint for SG/Send vs. WeTransfer and Proton Drive

Encryption is no longer our sole differentiator

IBM Plex Mono

We cannot position encryption alone as the differentiator against modern secure drives.

Proton Drive already uses client-side end-to-end encryption.

To win, we must reframe the conversation around the intersection of security and frictionless delivery.

IBM Plex Mono

Mapping the market: The Friction and Privacy Divide

The legacy market forces a compromise. Legacy giants sacrifice privacy for mass adoption, while secure silos demand heavy user friction and account lock-ins to maintain end-to-end encryption. SG/Send is the only platform operating in the high-privacy, zero-friction quadrant.

WeTransfer: The illusion of control

Architecture

Server-Side Encryption

IBM Plex Sans

Relies on standard HTTPS and encryption at rest. It is not end-to-end.
The provider holds the keys.

in IBM Plex Mono

Friction & Tracking

Account Walls

Senders require at least a free account and email verification to initiate a transfer.

Cookie-Heavy

Extensive use of tracking cookies and analytics on main product pages.

Commercial Lock-in

Strictly subscription-led monetisation forcing users from Free to Pro/Teams plans.

Legal Labyrinth

Governed by a lengthy 4,000+ word privacy policy.

Proton Drive: The secure, but locked silo

Security Foundation

Client-Side E2EE

IBM Plex Sans

Files are genuinely encrypted on the device; the provider cannot see plaintext stored files.

The Friction Cost

← → <https://proton.me/drive/file-sharing/id=987234XyZ>

Account-Centric Sharing

Full E2EE sharing flows assume the recipient also has a Proton account.

Opaque Experience

Shares rely on long, unmemorable URLs. No token-based gallery UX without signing up.

Bundled Subscriptions

Paid tiers are heavily bundled with broader Proton ecosystem plans.

Server-side Zero-Knowledge is an oxymoron

True zero-knowledge means the provider never sees the plaintext or the keys. Legacy tools encrypt data at rest, but control the keys. [SG/Send](#) encrypts files entirely in the browser before upload. Core implementations are visible on [GitHub](#) to prove it.

The frictionless sharing timeline

We do not rely on email verified accounts or opaque URLs. [SG/Send](#) uses a strict no-account model powered entirely by human-readable tokens.

Browsing structured galleries, not just downloading

Legacy tools offer basic file 'Previews' or require a login for full web access, failing to deliver a true token-based gallery experience.

The SG/Send Standard:

Recipients can instantly browse encrypted galleries, navigate folders, and utilize SgPrint directly in the browser, completely sidestepping the pointless download-to-view routine.

Verifiable transparency down to the code

Trust is earned through verification, not marketing. SG/Send operates with intentional minimalism.

Privacy Policy

Pricing

\$/month
Subscription

£0.01 / file.
True Pay-Per-Use.

The Competitive Blueprint Matrix

	SG/Send	WeTransfer	Proton Drive
Zero-knowledge (client-side)	✅ Browser encrypted	❌ Server-side/Provider keys	✅ Client-side
Recipients browse without download	✅ Gallery + Folder UX	❌ Previews only, no gallery	❌ Requires login for full UX
No account required	✅ Token-based	❌ Sender needs account	❌ Sharing flows assume accounts
Friendly tokens	✅ Short, readable	❌ Opaque IDs	❌ Opaque IDs
Zero cookies	✅ Verifiable in DevTools	❌ Trackers used	❌ Trackers used
Pricing model	✅ £0.01/file pay-per-use	❌ Subscription-led	❌ Subscription-bundled
Privacy Policy	✅ 6 sentences	❌ 4,000+ words	❌ Multi-page
Open Source	✅ Core visible on GitHub	❌ Closed	⚠️ Partial

The definitive SG/Send narrative

Code-Level Security.

End-to-end, zero-knowledge encryption happens in the browser before upload. The server never sees the keys.

Zero-Friction Delivery.

A fundamentally different recipient experience. No accounts, no opaque links, and no mandatory downloads—just instant, token-based gallery browsing.

Radical Transparency.

A verified zero-cookie footprint, open-source core crypto, a six-sentence privacy policy, and true £0.01/file pay-per-use economics.

Position the intersection of security and experience, not just encryption.
