

SGraph Platform Vision

Beyond File Sharing: The
Cryptographic Infrastructure for
Human & AI Collaboration.

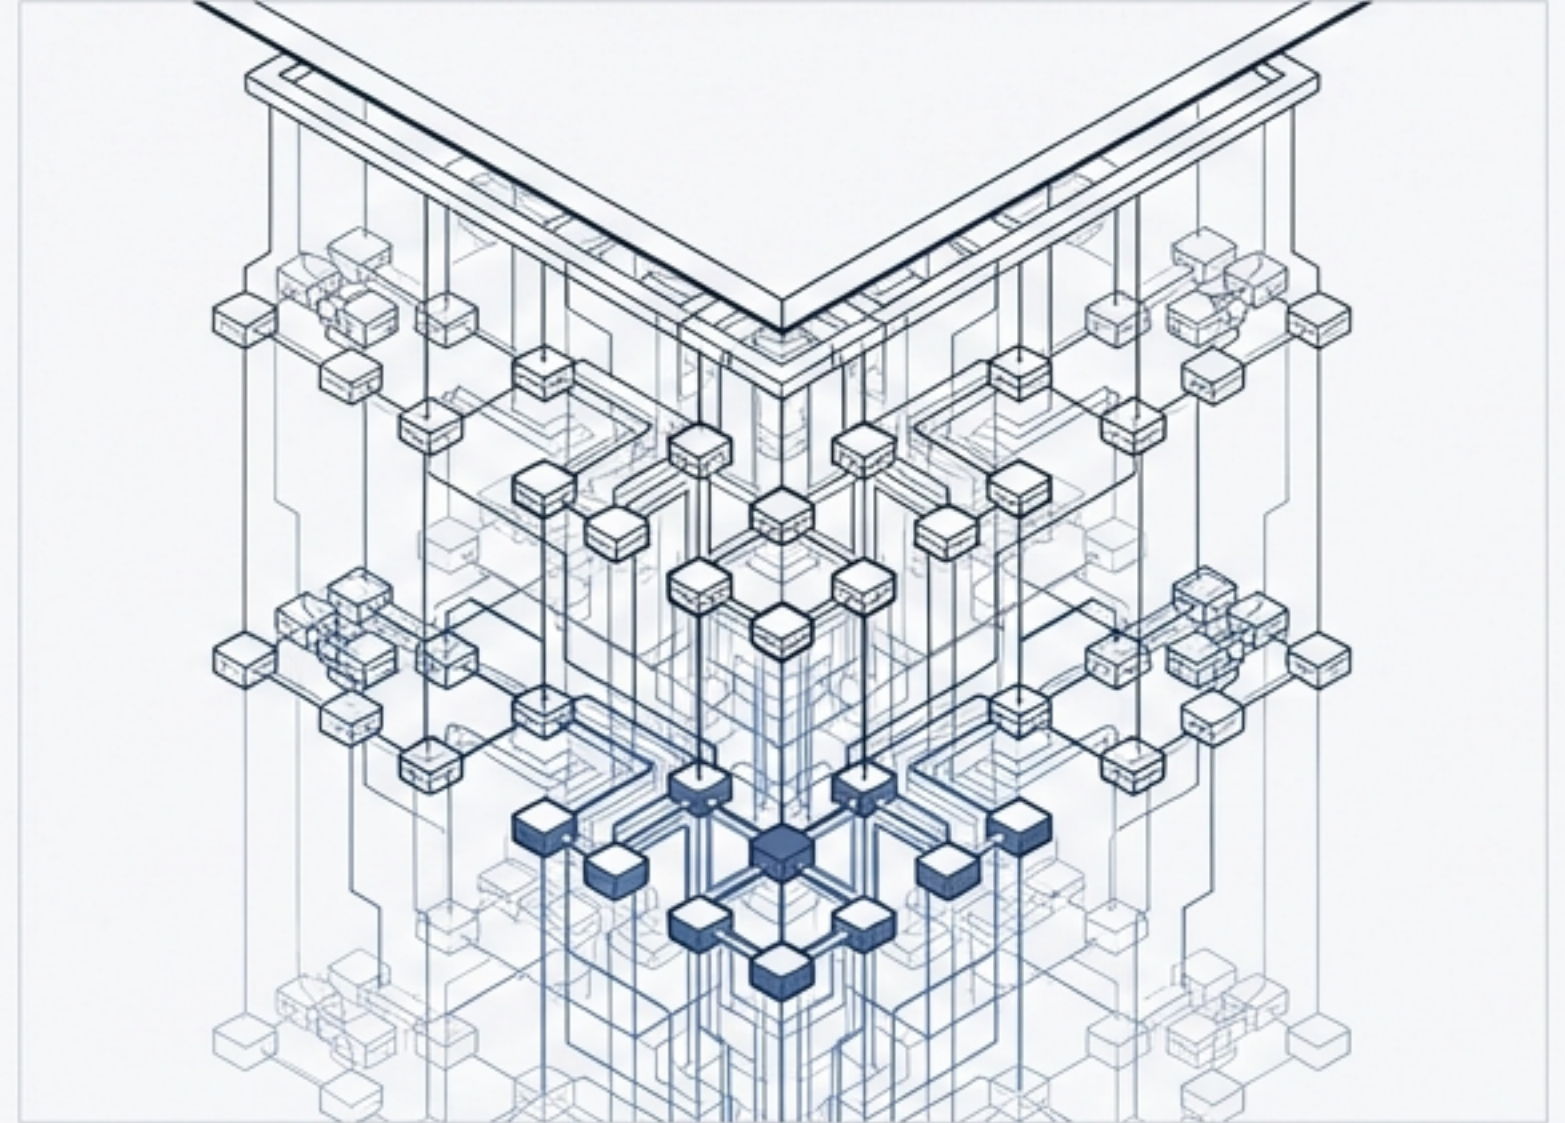

The surface is not the system.

SG/Send (v0.3.0)

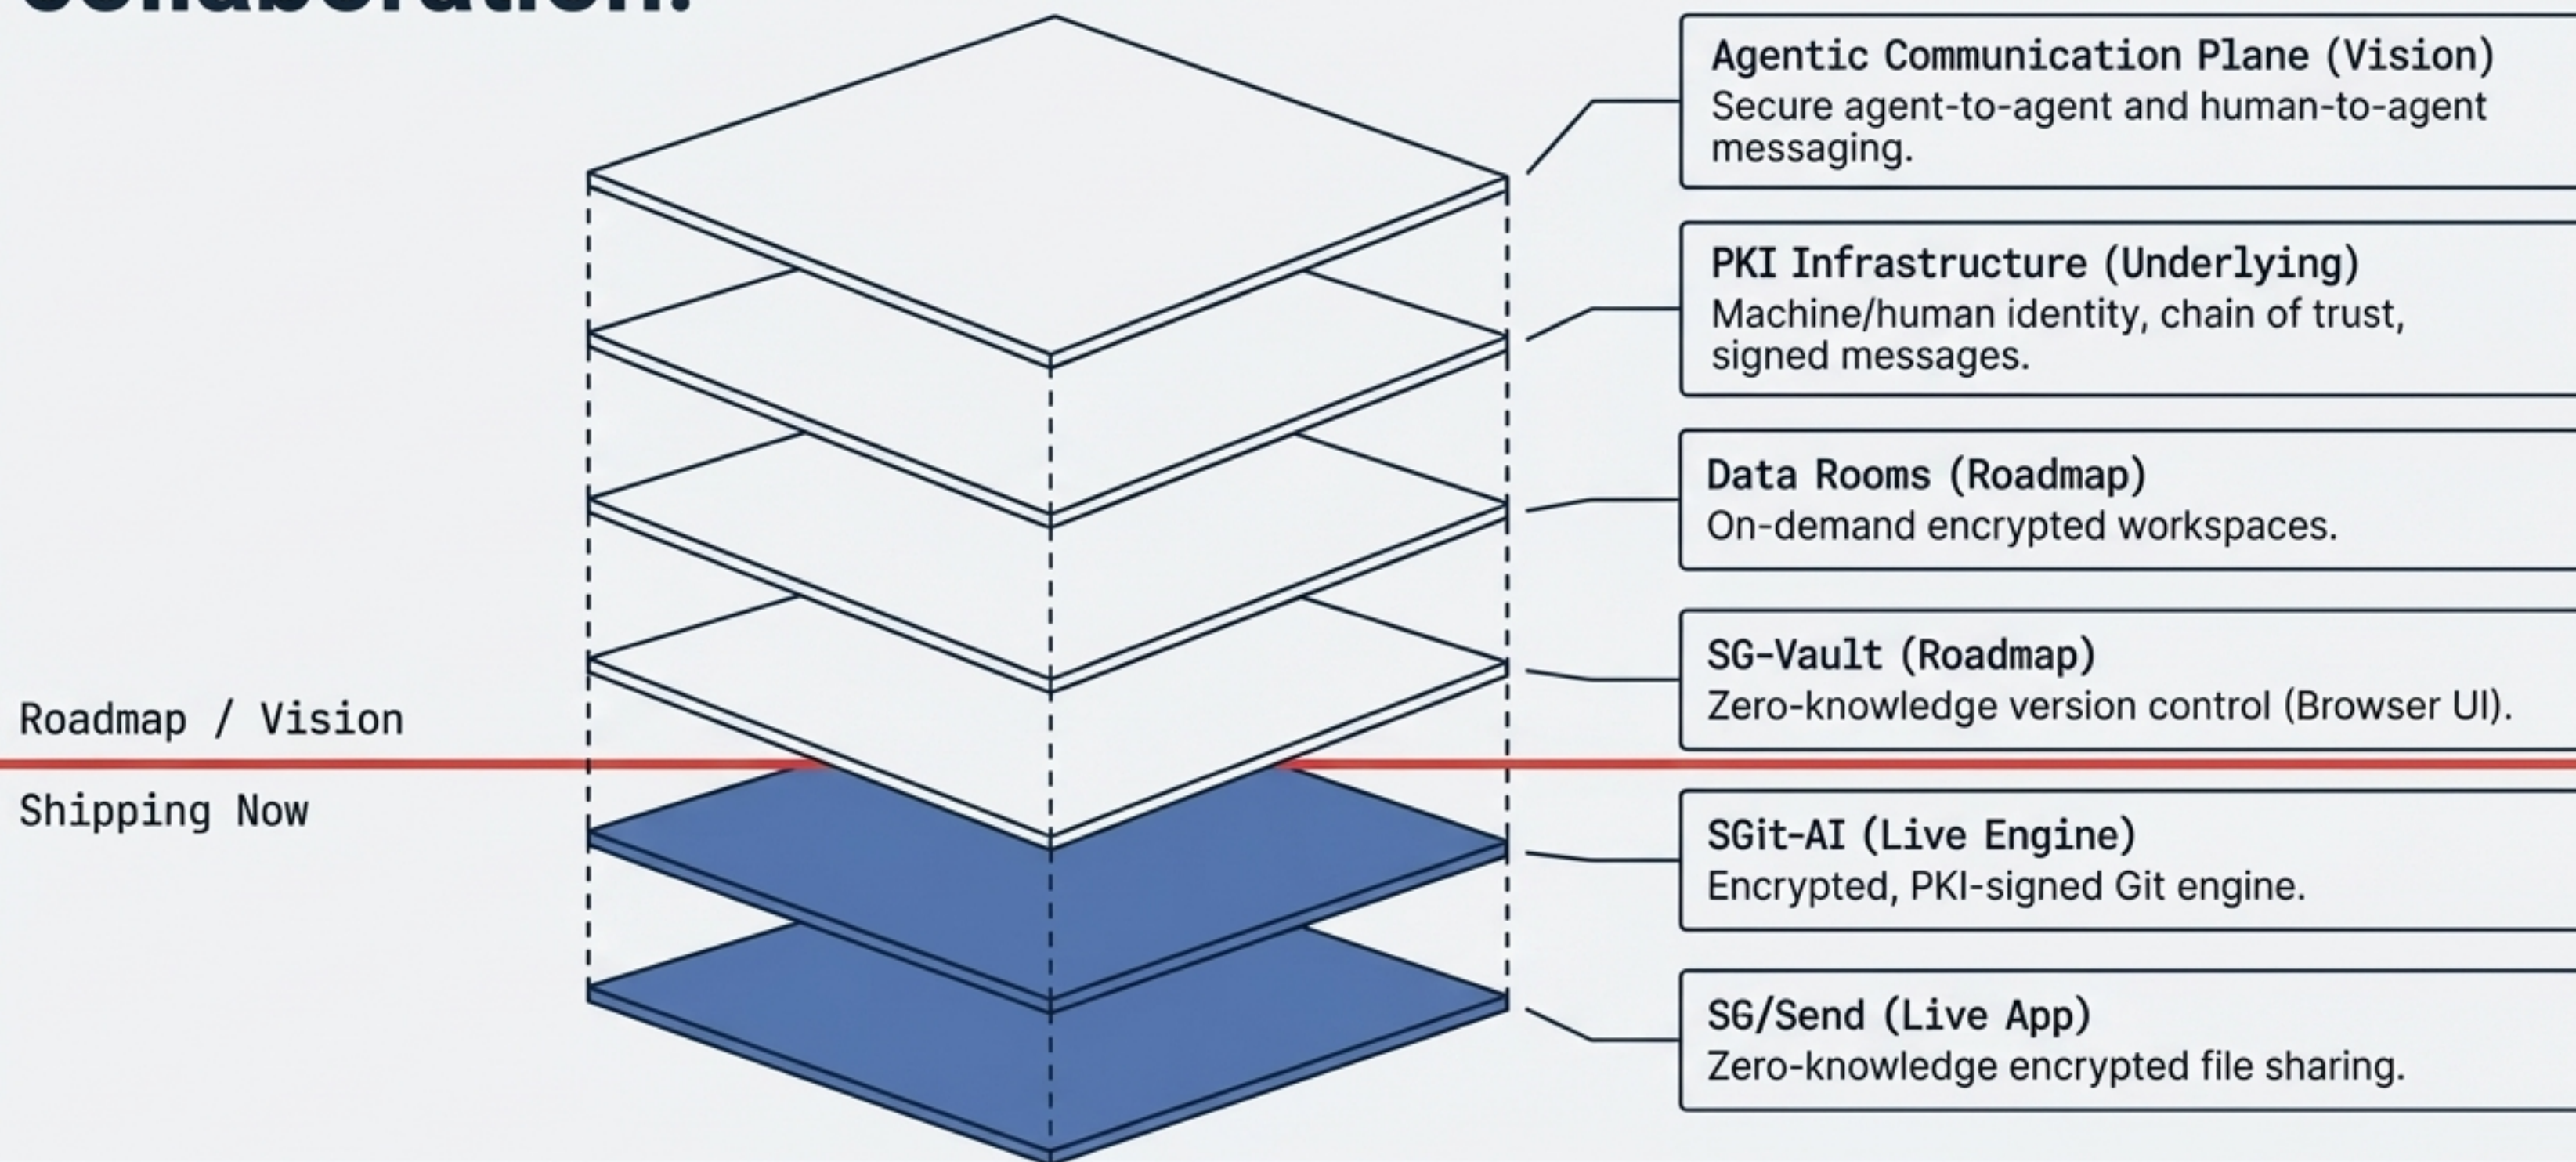

A highly secure file-sharing application.

SGraph Platform

The foundational cryptographic infrastructure built for the age of AI agents. SG/Send is merely the first entry point into a massive, zero-knowledge ecosystem.

Six layers of cryptographic collaboration.

Layers 1 & 2: The live reality.

The Portal

User-facing, zero-knowledge encrypted file sharing. Live today at v0.3.0.

```
> pip install sgkit-ai
> sgkit init vault
> sgkit commit -m 'Initial'
> sgkit encrypt --aes-256
```

The Engine

Developer infrastructure. Available right now via `pip install sgkit-ai`. Complete with a full CLI for vault operations, PKI, and cryptographic inspection.

Git, but encrypted and signed by default. Runs anywhere. No SSH.

Constraint

Standard Git in serverless/agent environments fails due to SSH and credential requirements.

AI Agent
Commit

SSH Firewall / Server Constraint

Port 22 Blocked

Agentic-First

Give AI its own **cryptographic identity**, not your overpowered credentials. Agents commit to their own branches, signed with their **own keys**.

Serverless Lambda Node

SGit-AI (Python/JS)

The SGit Solution

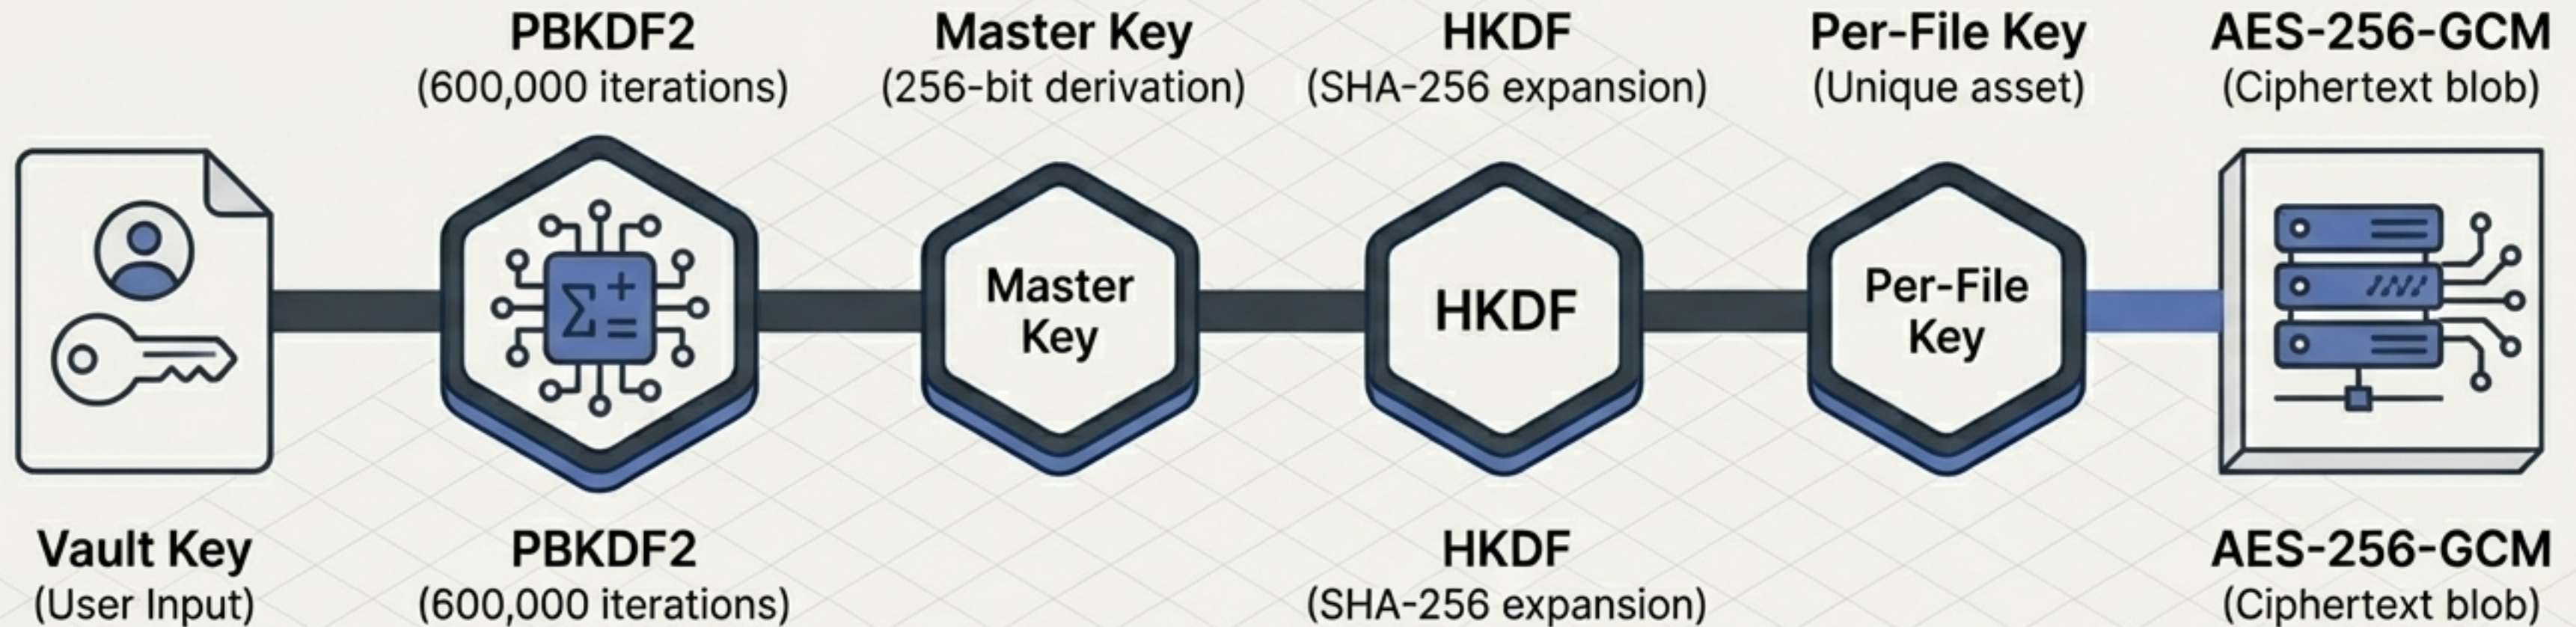

Written in pure Python & Browser JS.
Runs natively in Lambda functions,
CI pipelines, and browsers.

The architectural departure from legacy version control.

	Legacy Git	SGit-AI
Authentication	SSH Keys / Overpowered Tokens	Zero-server PKI Branch Keys
Provenance	Optional GPG	Mandatory PKI signing per commit
Content Storage	Plaintext files & diffs	Opaque AES-256-GCM ciphertext blobs
Environment	Requires Host OS/Local install	Pure Python / Browser Web Crypto
Primary Actor	Human Developers	AI Agents & Humans equally

Absolute Zero-Knowledge: The SGraph Crypto Pipeline.

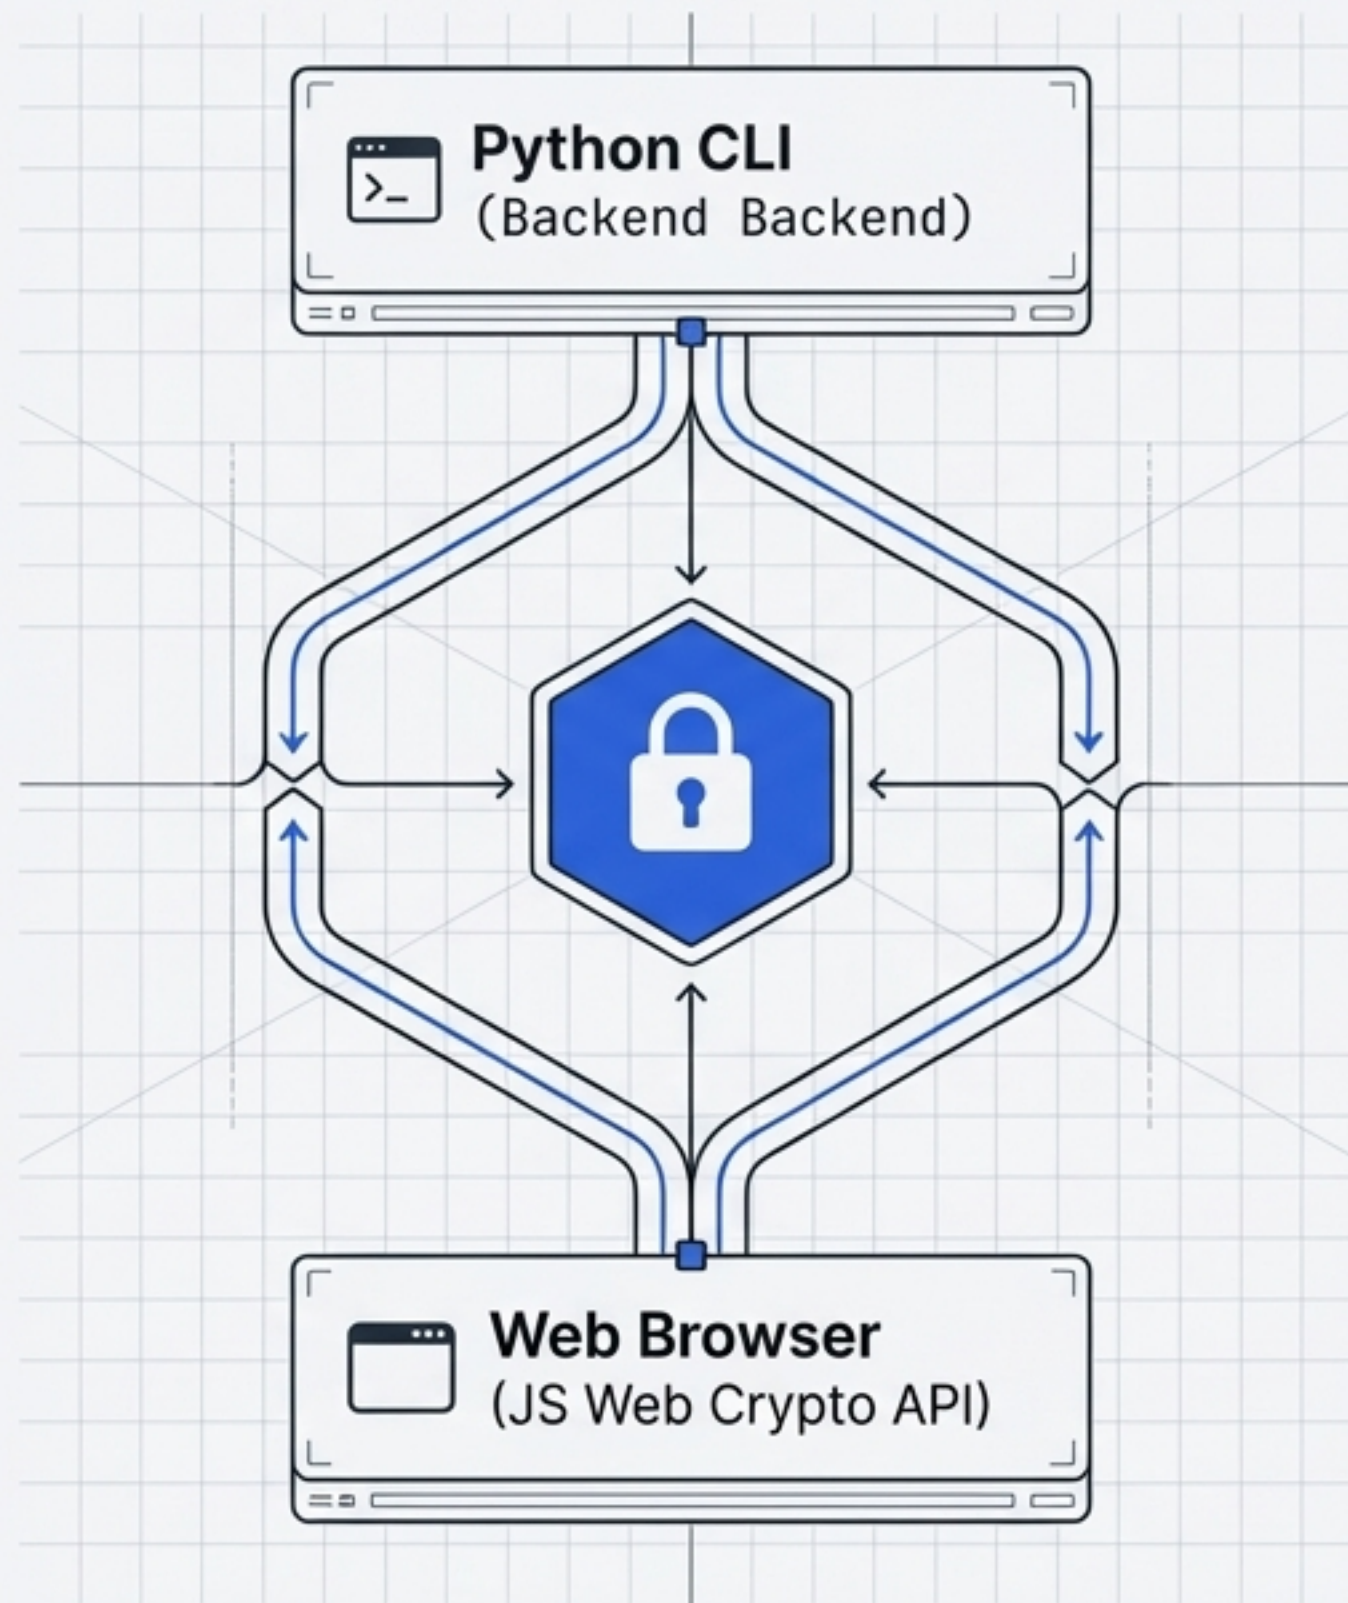

The server only ever stores **opaque ciphertext blobs**.
File names, folder structures, and underlying content are entirely
mathematically obscured from SGraph.

The Web Crypto Interop Bridge.

Core Concept

Identical cryptographic operations execute flawlessly across environments.

The Result

Keys derived in a developer's terminal produce the exact same AES-256-GCM ciphertext as keys derived by a client in a browser tab.

This interop is the foundation of the SGraph platform.

Layers 3 & 4: From ephemeral sharing to persistent collaboration.

SG-Vault

SG-Vault

The browser-based UI for SGit. Providing zero-knowledge version control with integrated PKI signing and provenance tracking.

Data Rooms

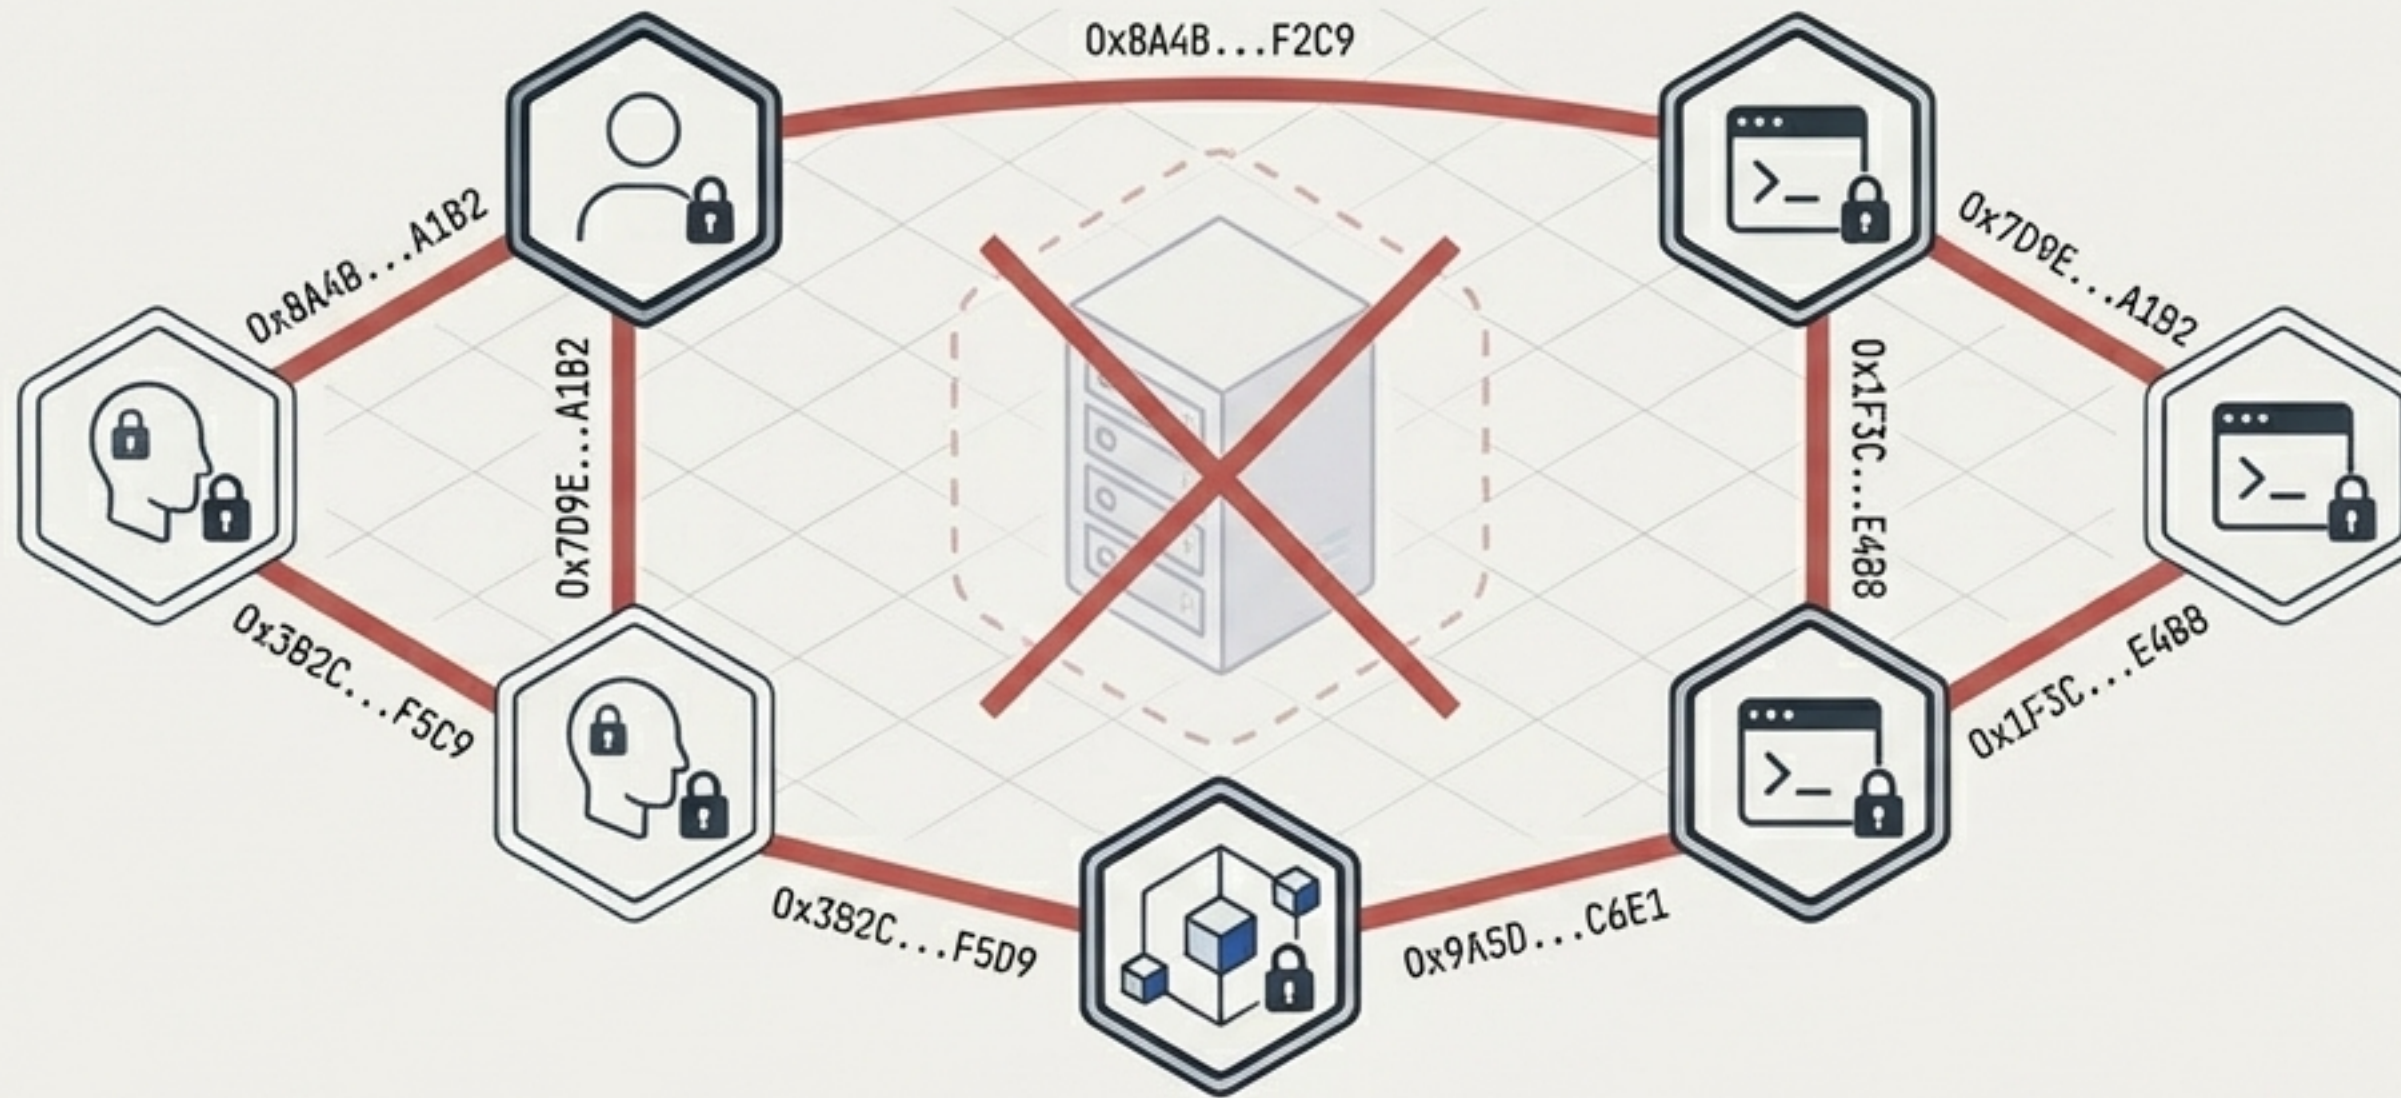

Data Rooms

On-demand, zero-knowledge workspaces. Ephemeral or persistent virtual rooms designed for multi-party audits, deal-making, and secure research environments.

Layer 5: Zero-Server PKI Infrastructure.

Chain of Trust

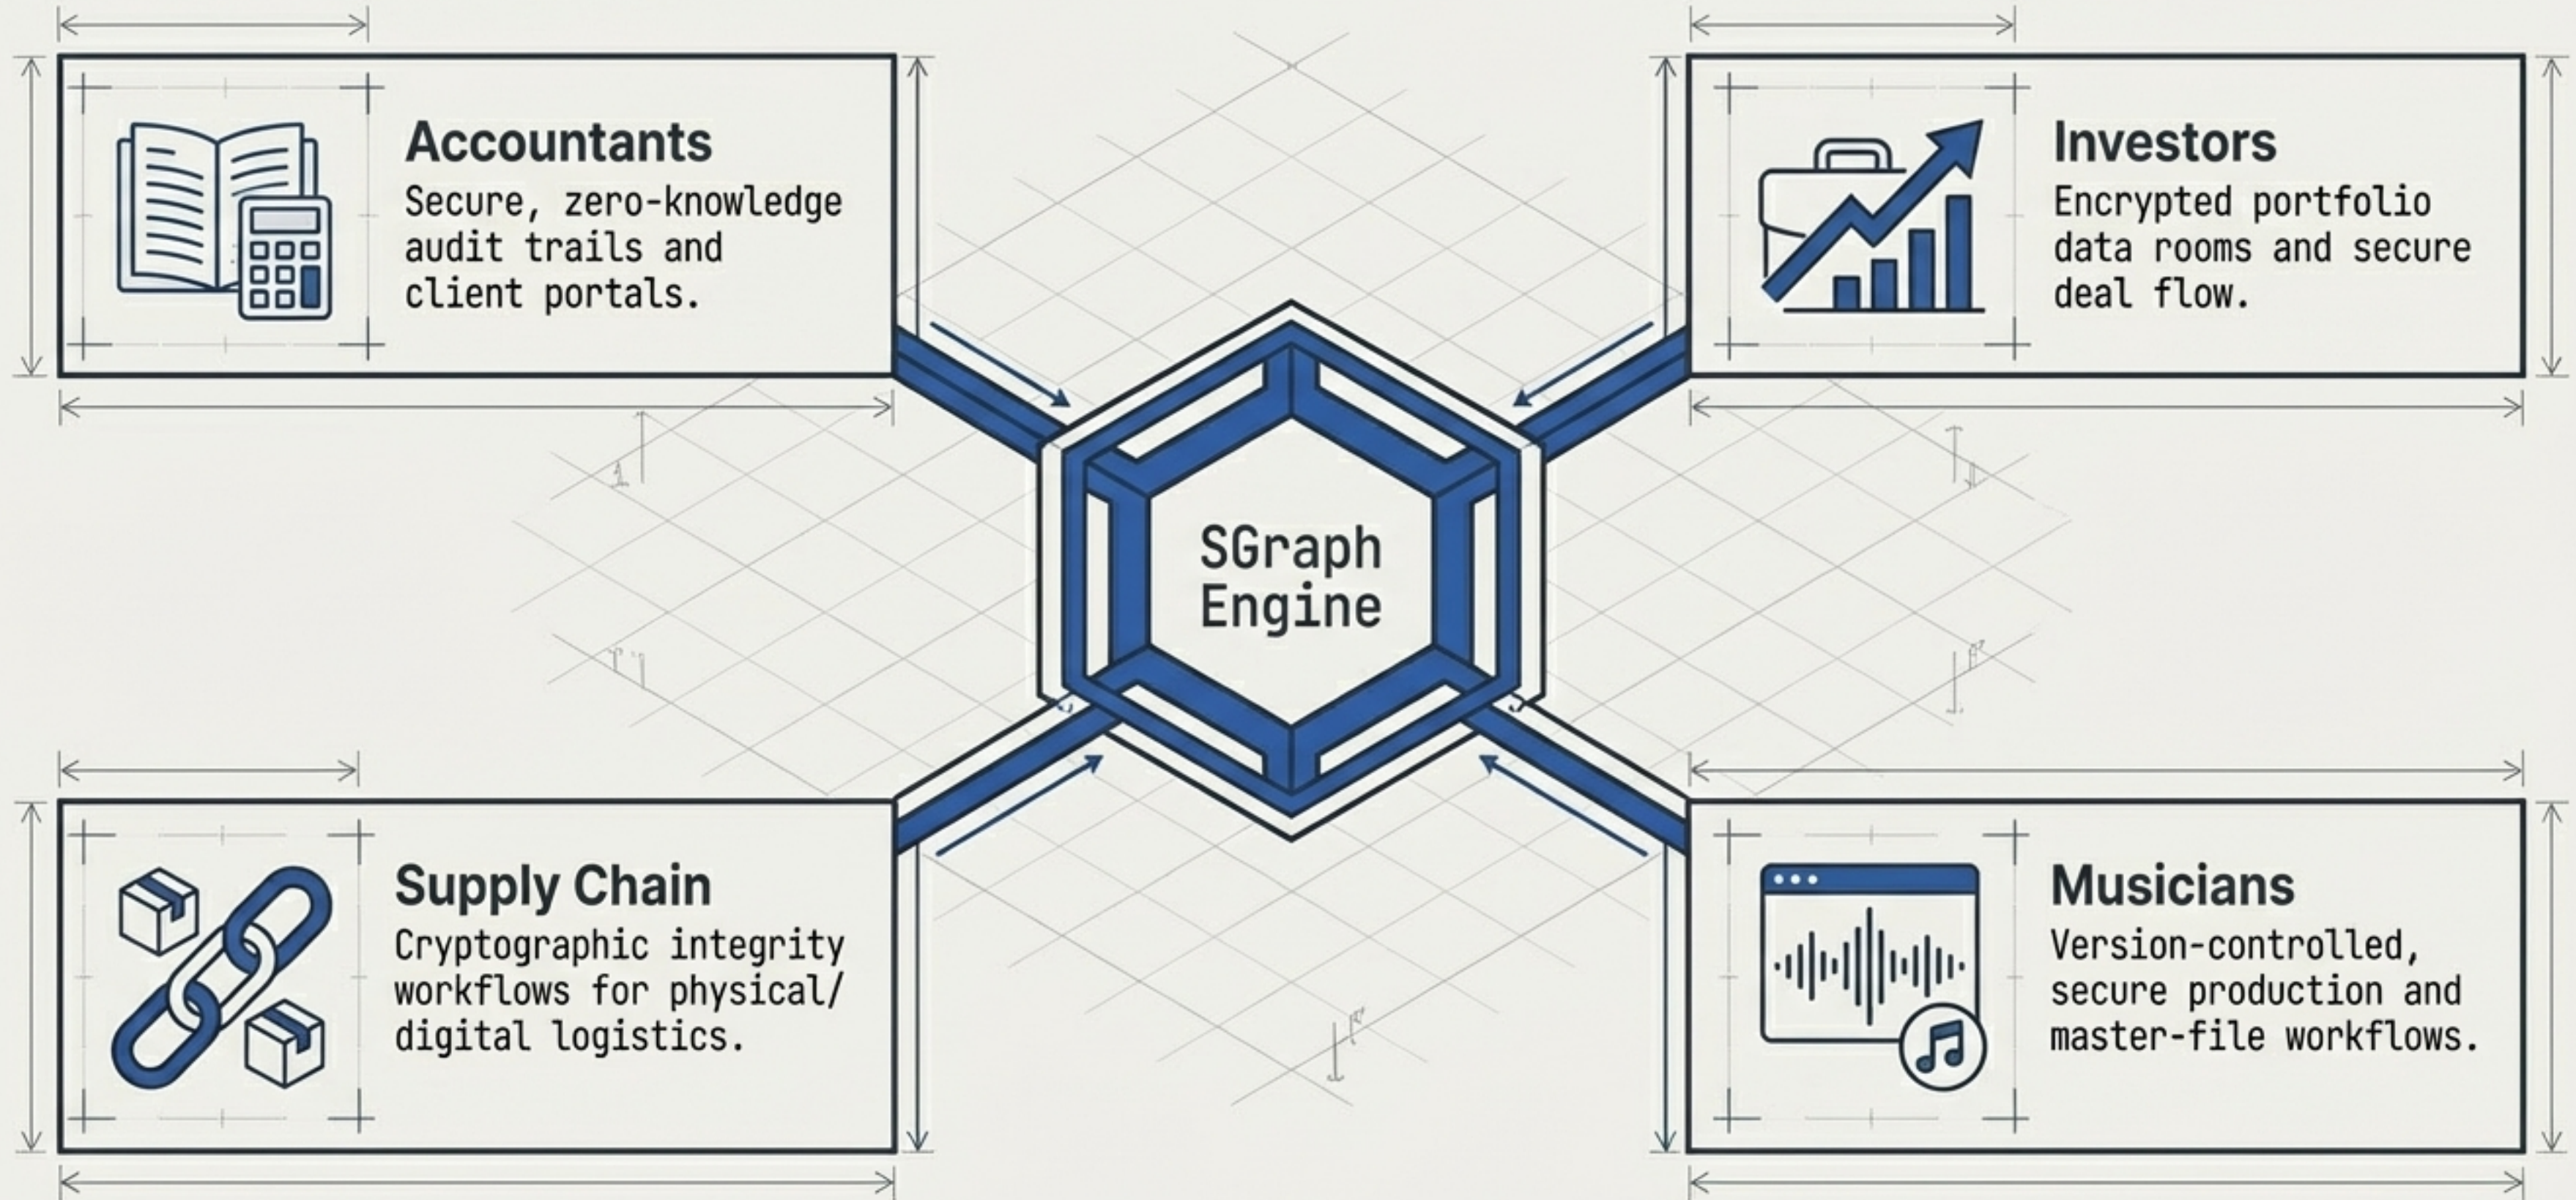

The Foundation of Trust

Machine and human identities are verified without a central authority holding private keys. Enables true signed messages and key discovery.

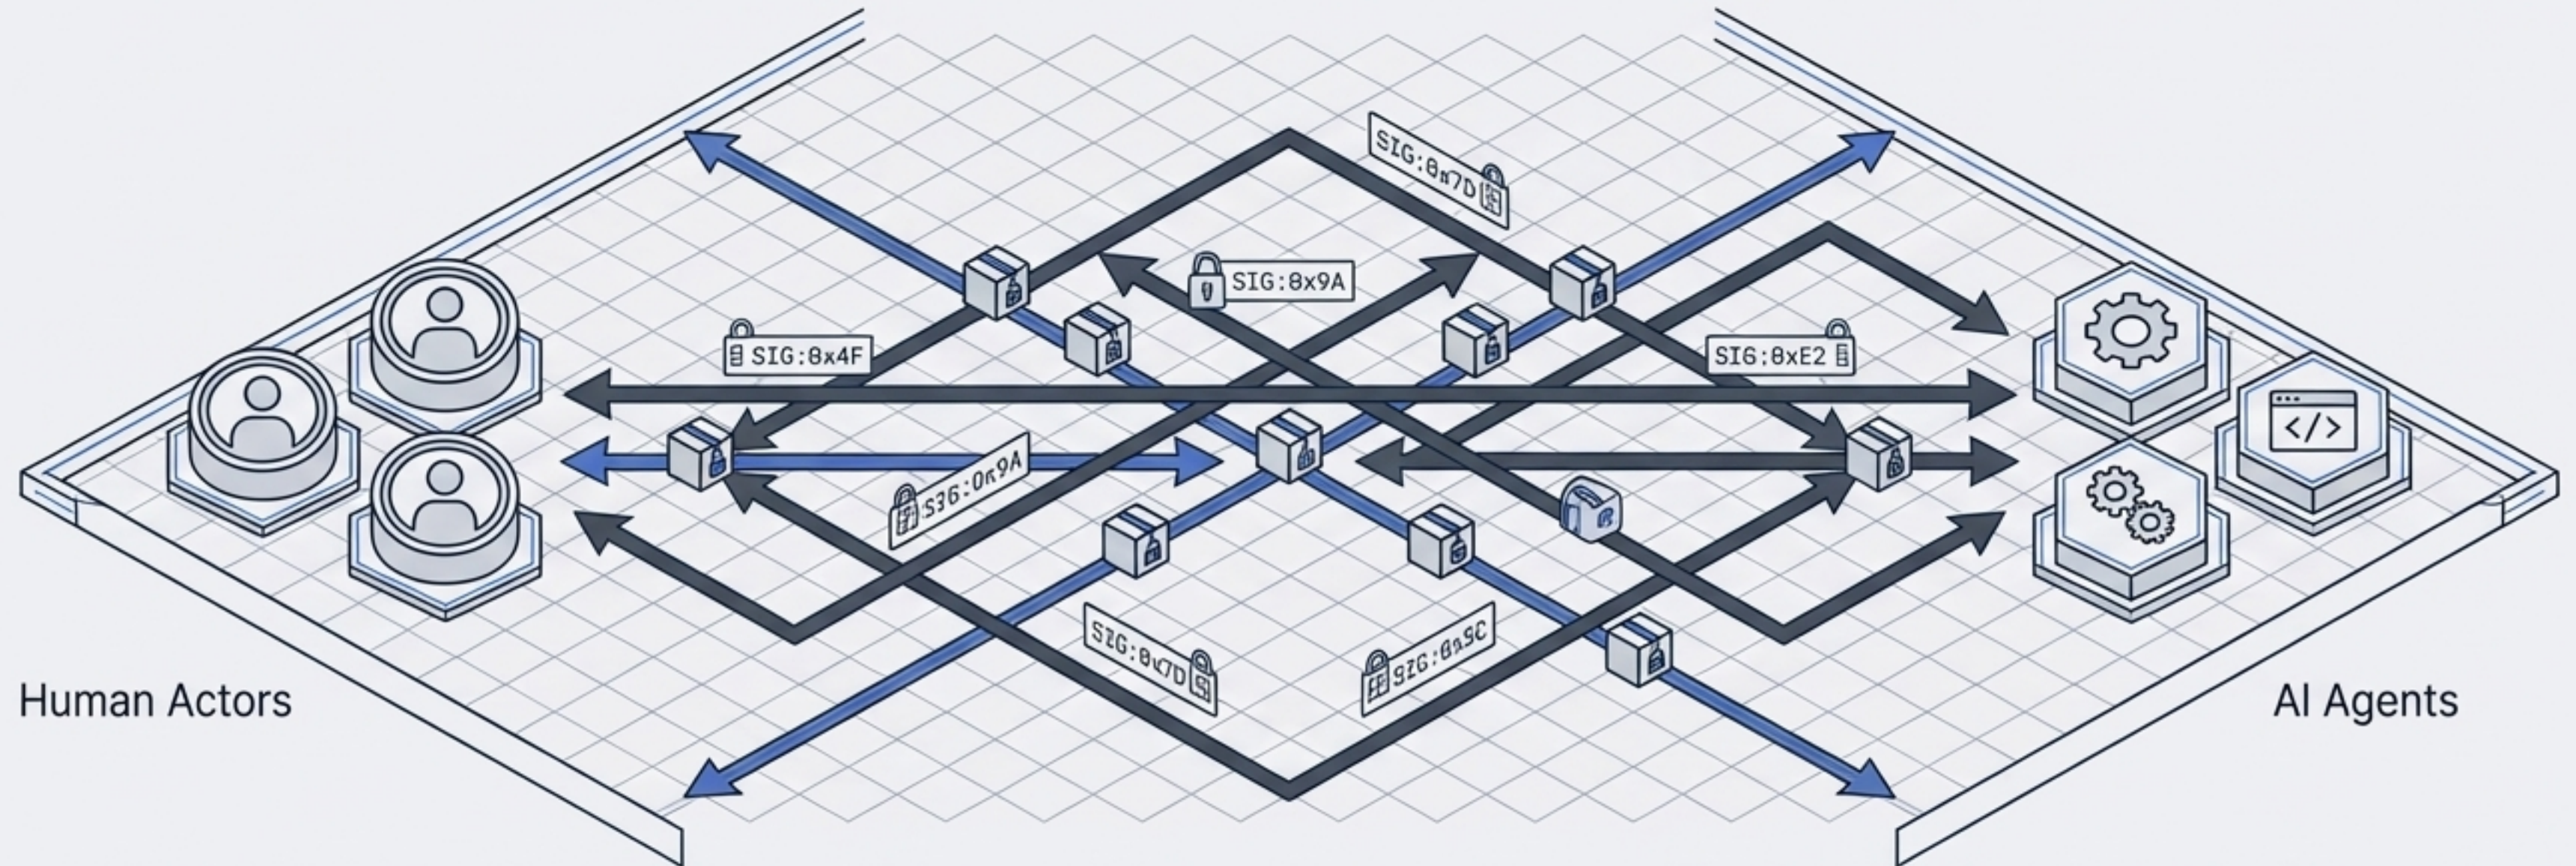

Privacy as Architecture

Embedded DPO (Data Protection Officer) workflows and DSAR (Data Subject Access Request) compliance engineered from Day One. Trust is a spectrum, secured by mathematics, not corporate policy.

Powering the Five Tiers of Data Collaboration.

Layer 6: The Agentic Communication Plane

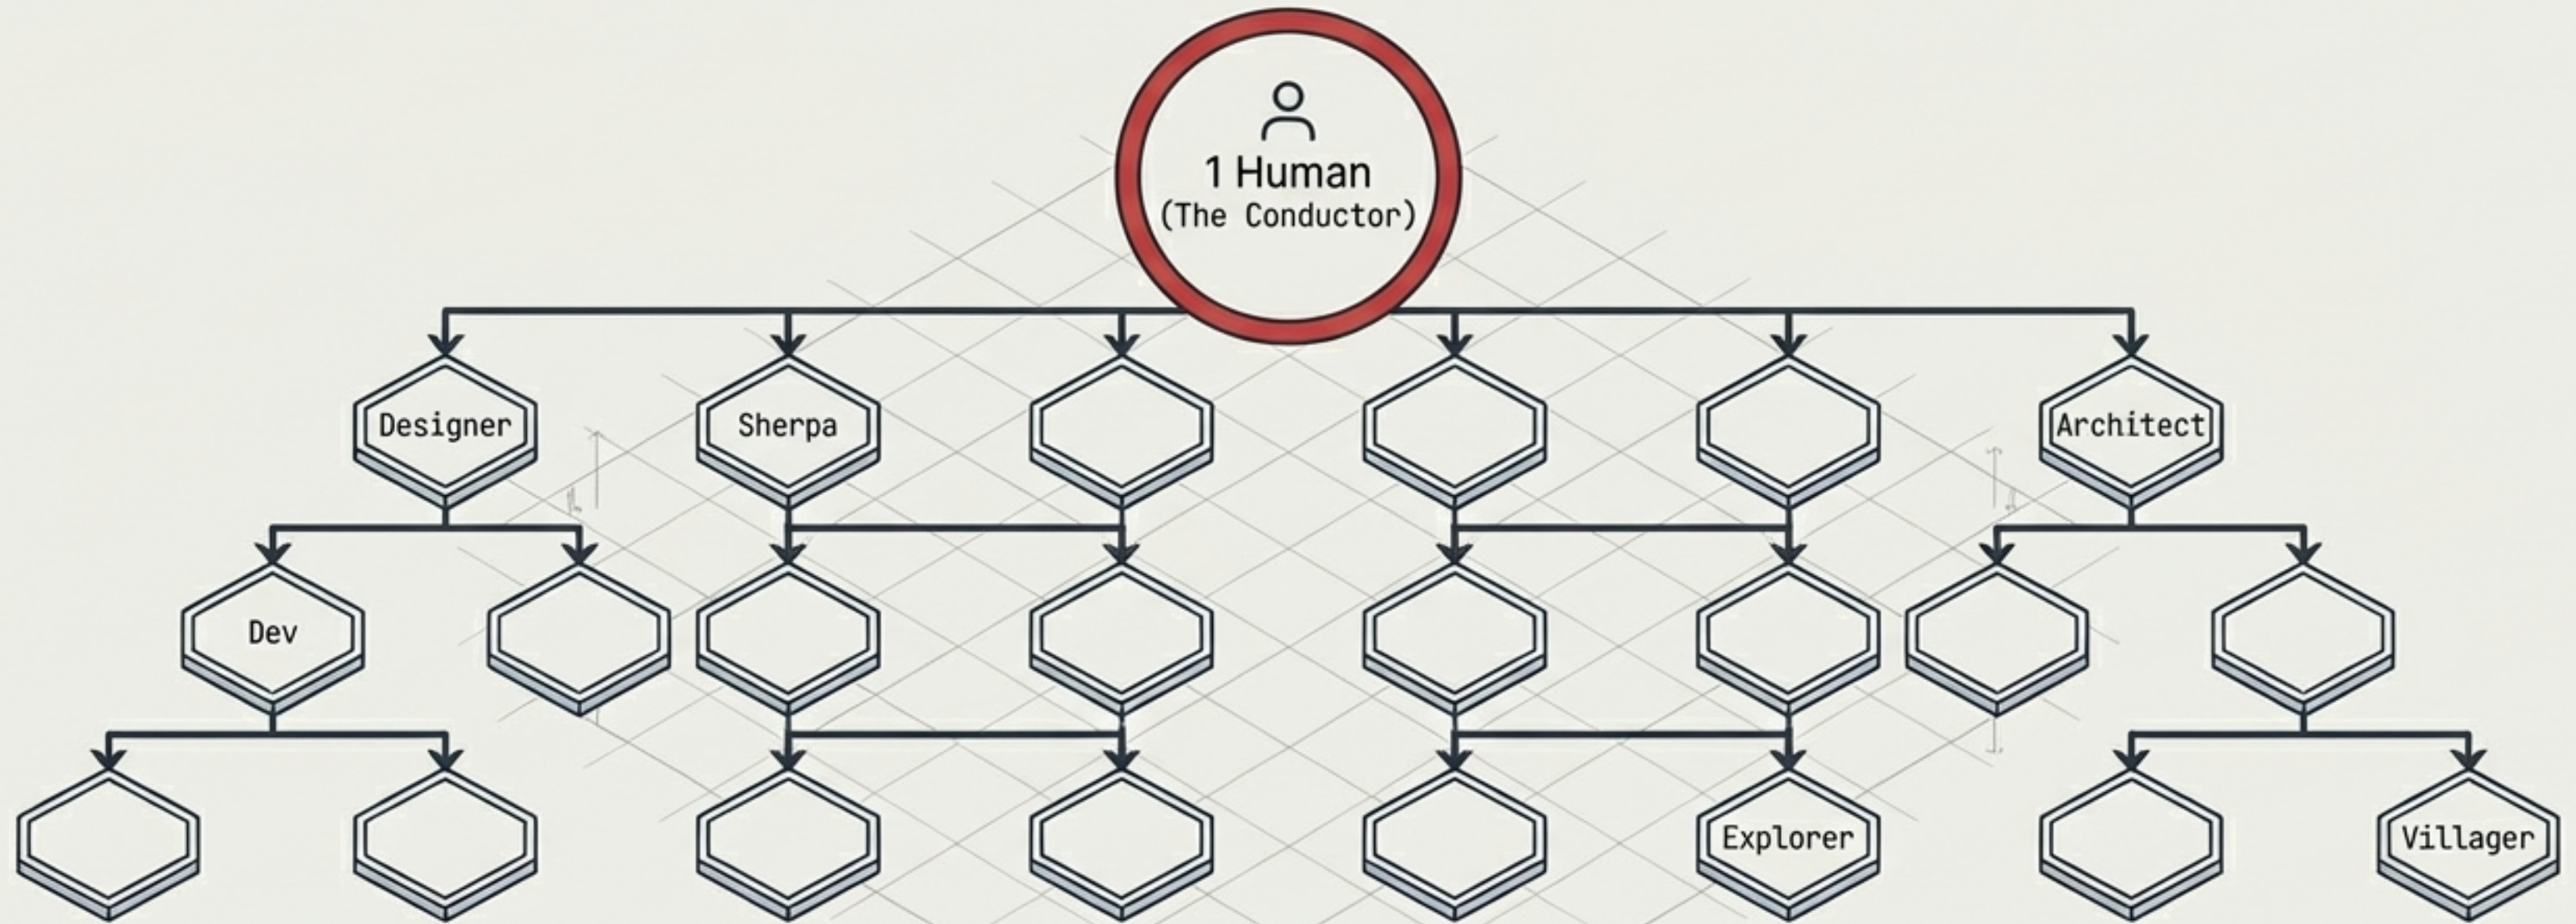

The Ultimate Vision

SG/Send and SGit are the foundations for a **signed message plane**.

The Paradigm Shift

A **zero-knowledge environment** where AI agents and humans exchange encrypted, authenticated messages with perfect, mathematically verifiable **provenance tracking**.

Building the future with its own tools.

The SGraph Team Model

The platform is built using the exact same agentic communication patterns it enables.

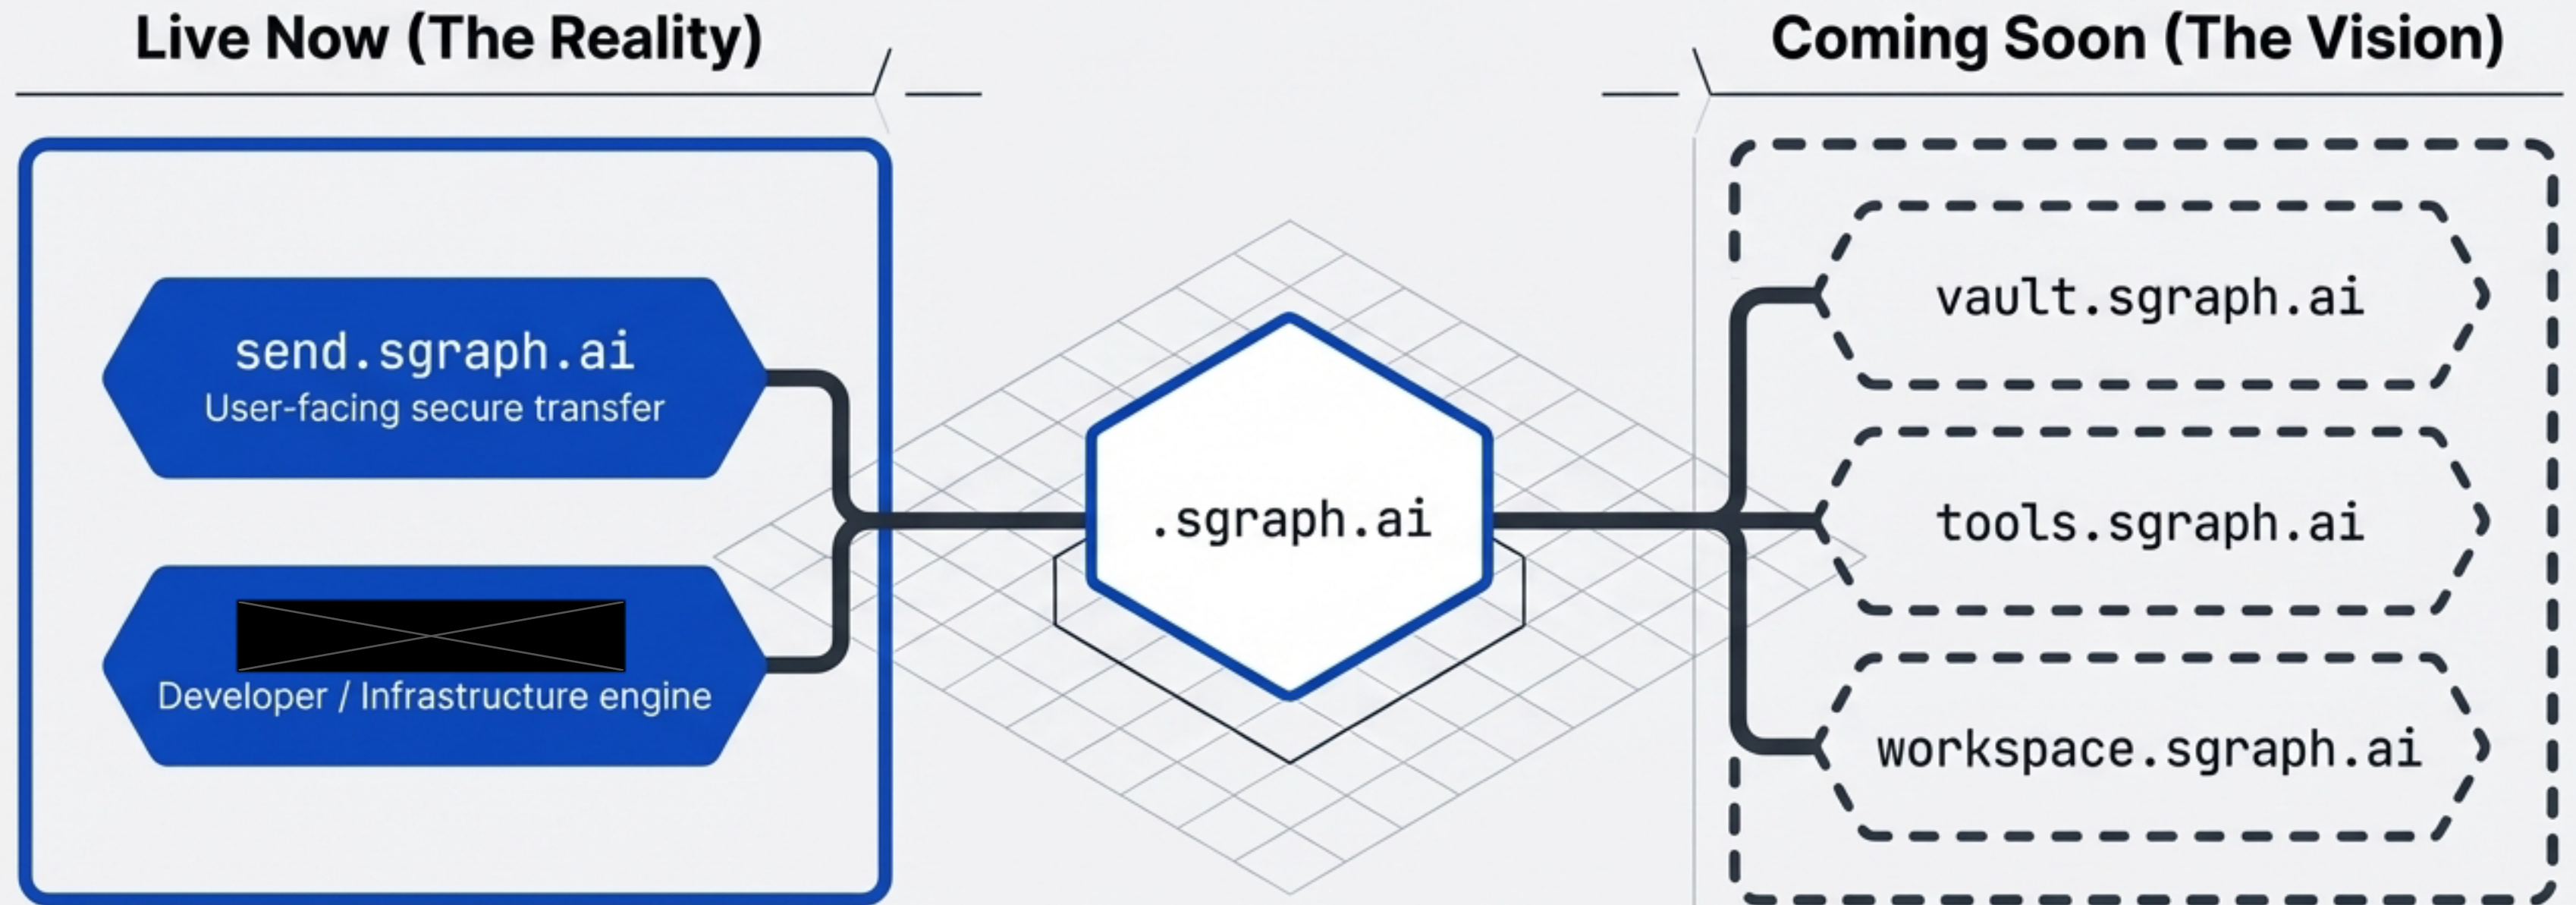

Extreme Velocity

An 18-agent powerhouse software workflow, coordinated entirely by a single human conductor.

LLM Cost Engineering

Sustaining high-velocity output at a radically optimized operational cost of just \$200/month.

The Path Forward: Navigating the Ecosystem.

We only claim what is shipped. We sell the reality of today, powered by the architecture of tomorrow.
