

Reactivating the Cyber Boardroom with Agentic Infrastructure

The Mission:

Empowering cybersecurity executives to communicate with boards in their language.

The Catalyst:

SG/Send's agentic architecture provides the missing link to make the unit economics viable.

The Blueprint:

A highly technical, secure, and scalable packaging of SG/Send infrastructure for the cybersecurity advisory market.

Business Risk

Culture

Role-Specific Impact

Boards Require Translation, Not Technical Education

- Board members are sharp and capable, but lack deep cybersecurity expertise.
- They think in risk frameworks, not technical vulnerabilities.
- CISOs urgently need help packaging their complex security messages for this audience.

A Correct Mission Waiting for the Right Infrastructure

The Cyber Boardroom was never a flawed concept; it was a product ahead of its time.

- Delivering highly sensitive, bespoke board briefings required secure, scalable automation that did not exist.
- We do not need to rebuild a separate product. The Cyber Boardroom is simply a strategic packaging of SG/Send's existing agentic capabilities.
- The Vision
- The Reality

The 20-Day Consulting Gap

10–20 Days ⚠

The Buyer:

CISOs, board-level advisors,
and consulting firms.

The Friction:

Companies refuse to pay for
20 days of consulting just to
get a baseline briefing.

The Bottleneck:

Consultants lack the time to
scale this manual process across
multiple clients. The market
remains artificially small.

Flipping the Economics to a 3-Day Engagement

The Agentic Swarm:

Each engagement deploys a mini agent team configured with sector-specific CLAUDE.md roles.

80% Agent Execution:

The swarm handles research, structured questionnaires, and drafting.

20% Human Expertise:

The CISO handles high-level judgement, relationship management, and boardroom presence.

The Result:

A single CISO advisor can now seamlessly serve 5–10 board clients simultaneously.

The Missing Capabilities Are Now Online

 Secure data rooms for sensitive materials	 Zero-knowledge encrypted data rooms
 Agentic research & packaging	 18-role agent team, CLAUDE.md, Issues-FS
 Scalable per-engagement deployment	 Claude Code Web + scoped MCP
 Secure stakeholder communication	 Sherpa inbox, multi-agent email, in-browser viewers

Every Engagement is a Secure SG/Send Environment

The Nexus:

The data room acts as the secure boundary for board materials, analysis, and the agent workspace.

The Output:

Sensitive briefing materials are delivered to board members via one-time secret links.

The Presentation:

Board members view PDFs, dashboards, and reports directly in-browser via data room viewers.

Verifiable Trust for Security Posture Data

Why a company will say yes to an AI advisory team:

Verifiable Audit Trails:
Complete visibility into exactly what the agents accessed within the data room.

Scoped MCP Access:
Granular, read-only access restricted entirely to the specific engagement.

Human Verification: The CISO reviews and approves all briefings in the data room before board delivery.

Zero-Knowledge Encryption: Cryptographic proof that sensitive data never leaks from the environment.

The Underlying SG/Send Machinery

Email-FS (v0.7.4): Enables inspectable, verifiable agent-to-agent communication during the research phase.

n8n Encrypted Envelopes: Powers the engagement workflows (research → interview → brief → deliver) with end-to-end encrypted data.

Sherpa Inbox Workflow:
Manages seamless, secure client communication using the exact same infrastructure as core SG/Send.

Kickstarting Adoption via Open-Source Templates

The Strategy:

Do not wait for the market to form. Create it by shipping a public, forkable template.

The Asset:

A sector-neutral repository containing CLAUDE.md files, role definitions, and folder structures.

The Action:

Any CISO, security consultant, or advisory practice can fork the repo, point it at their client, and immediately deploy their own Cyber Boardroom.

The Dual-Funnel Dogfood Strategy

- We will apply the Cyber Boardroom to SG/Send itself as a live, public demonstration.
- When a CISO's contacts test the **workflow**, their questions route directly to SG/Send's Sherpa.
- The Impact: Every live demonstration of the Cyber Boardroom doubles as an interactive sales pitch for core SG/Send capabilities.

Packaging Infrastructure for Vertical Markets

SG/Send Standalone

Targets anyone sending files/secrets.

Value prop is encrypted file transfer.

Revenue is usage-based.

Cyber Boardroom on SG/Send

Targets cybersecurity board advisory.

Value prop is an agentic consulting platform.

Revenue is engagement-based.

Parallel:
Agentic
Healthcare
Packaging

Every Cyber Boardroom deployment acts as a recurring, monetisable SG/Send environment.

Riding the Symmetric Market While PKI Matures

- The ultimate vision relies on mass PKI adoption (per-recipient encryption, verified identities).
- However, SG/Send already commands a competitive advantage in symmetric-mode file transfer and one-time secrets.
- The Cyber Boardroom bypasses the PKI dependency, riding the viable symmetric market today while actively building toward the PKI-enabled future.

Tomorrow: PKI-Enabled Market

Today: Symmetric-Mode Market

Execution Timeline and Acceptance Criteria
