

The GenAI Usage Paradox

Why domain experts—not novices—must become the power users of agentic workflows.

A familiar conversation.

“I use AI for the things I’m not good at. The areas where I have doubts, where I don’t understand something. That’s where I go to the LLM.”

This feels productive. It is actually a **fundamental misunderstanding** of the technology.

The Illusion of Productivity

People use AI as a substitute for expertise they lack. The output mimics the correct structure perfectly, but the foundational knowledge is absent.

Law

Drafting legal contracts without legal training.

Result: Cannot spot the hallucinated clause.

Software

Debugging systems without development expertise.

Result: Cannot see the subtle structural bug.

Medicine

Creating clinical summaries without medical knowledge.

Result: Cannot catch the clinical error.

The Mechanical Failure of the Default Path

When you lack domain knowledge, you cannot supervise the machine.
Without a human quality gate, the AI generates flawless-looking inaccuracies.

Inverting the Model

The real value of agentic AI is not for the things you don't know. It is for the things you know deeply.

You don't need the AI to think for you.
You need it to **execute** for you.

Reclaiming the Workstream

The Direction

- Consumes 20% of the Time
- Requires 80% of the Expertise
- Critical thinking, direction-setting, quality control

Assigned to: Human Expert

The Plumbing

- Consumes 80% of the Time
- Requires 20% of the Expertise
- Scaffolding, repetitive structuring, non-functional requirements

Assigned to: Agentic AI

Agentic AI in Practice

The expert runs parallel sessions across different repositories. The AI does the heavy lifting; the human provides the critical quality gate to spot flaws instantly.

GT Sectra: The Amplification of Mastery

Extracting Performance

'Give me the most advanced machine, because I can extract every ounce of performance from it.'

Using AI to win races, not to park. The master driver extracts maximum performance safely.

Handing Over Controls

'I don't know how to fly a plane, so I'll let the AI fly for me.'

Letting AI fly a plane you cannot land. The passenger hands over controls they do not understand, creating immense unseen risk.

Diagnosing AI Usage Behaviours

Criteria	The Non-Expert	The Domain Expert
Motivation	Substitutes missing knowledge	Amplifies existing knowledge
Adoption Rate	Enthusiastic & reckless	Hesitant & sceptical
AI's Role	The Thinker	The Executor
Quality Control	Blind trust	Instant QA / The Quality Gate
Ultimate Outcome	Confident Nonsense	Scaled Expertise

The Friction Points

The people most poised to extract transformative value are the ones pushing back the hardest.

01 Fear

The anxiety of being replaced by the very system they are supposed to guide.

02 Assumption

The belief that if they are already masters of their craft, technology has nothing left to add.

03

They have only seen AI used as a novice's toy; they have not seen an agentic workflow driven by true domain mastery.

Unleashing Un-tooled Professions

Entire professions with deep knowledge rely on spreadsheets because nobody ever built proper software for them.

**Generic Tools
(Manual Processes)**

**Custom Agentic
Workflows**

Agentic AI changes this. A domain expert can now describe exactly what they need in natural language. They no longer adapt to generic tools; the workflow adapts to them.

The Golden Rule of Generative AI

AI is not a knowledge-creation tool; it is an execution-multiplier. The technology yields completely opposite outcomes based entirely on the presence of a human quality gate.

**Delegate what you know to scale.
Do not delegate what you don't.**
