

# SG/Send Vault: The Zero-Knowledge Integration Brief

Secure delivery for AI-generated  
research via SGit.

Version: v0.16.28

Date: 20 March 2026

Classification: Business Confidential

# The GenAI Delivery Vulnerability

GenAI outputs synthesise highly sensitive strategic data and proprietary analysis. Delivering these insights to executives via traditional systems exposes the data in plaintext to intermediary servers, administrators, and infrastructure logs.

**The Requirement:** A delivery mechanism that protects confidential data mathematically after generation.

# The Paradigm Shift: Policy vs. Mathematics

## Traditional Server Trust

1. Research stored in plaintext
2. Administrators can read content
3. Sharing requires trusting intermediaries
4. Access enforced by application logic

## Mathematical Trust

1. Research encrypted client-side
2. Server mathematically cannot decrypt content
3. Sharing uses cryptographic keys
4. Access enforced by encryption (no key = no access)

# Out-of-the-Box Zero-Knowledge Storage

## Personal Vaults

Zero-knowledge encrypted workspaces featuring hierarchical folder structures, multi-format file support, and full encrypted version history via SGit.

## Data Rooms

Shared encrypted spaces designed for team collaboration. Features secure invite codes and 24-hour mathematically revocable session tokens.

## Role-Based Access

Granular permission models featuring Owner, Editor, and Viewer states. Permissions are mathematically enforced directly at the cryptographic vault level.

# The Architectural Guarantee

**CORE RULE:** Keys never leave the client environment.

# AI-Native Integration Ecosystem

## Vector 1: MCP Server

Exposes all vault operations via the Model Context Protocol, allowing Claude.ai and other autonomous agents to read and write securely.

# The Secure Delivery Pipeline

# Frictionless Executive Consumption

High-grade cryptography with zero installation required for the end-user.

## Web (Zero Install)

Instant access via any modern browser.

URL: `send.sgraph.ai`

## Desktop

Apple-signed, Gatekeeper-approved Tauri application.

## Mobile

End-to-end encrypted Android application. Pixel 6 validated.

## CLI

Deep Python integration for custom workflows.

# Dual Value Creation

## Value For Your Platform

### **Differentiated Security**

**Narrative:** Stand out with true zero-knowledge architecture versus competitors relying on plaintext.

### **Native Compliance:**

Regulatory standards are achieved structurally through mathematics, not through fragile administrative policies.

### **Drastically Reduced Liability:**

In the event of a server breach, encrypted vault contents are mathematically useless to attackers.

## Value For Your Customers

### **Absolute Confidentiality:**

Unshakeable confidence that proprietary research and strategic insights remain completely private.

### **Zero Friction Access:**

Executives consume research seamlessly through their browser without installing new software applications.

### **Audit Visibility & Air-Gapping:**

Complete transparency over document access, with the ability to clone vaults locally for offline review.

# Architectural Compliance for Regulated Industries

| Regulated Industry | Compliance Trigger                      | SG/Send Architectural Resolution                                                                             |
|--------------------|-----------------------------------------|--------------------------------------------------------------------------------------------------------------|
| Financial Services | Client confidentiality & SOX compliance | Resolved via <b>zero-knowledge storage</b> and <b>immutable hash-chained audit trails</b> .                  |
| Healthcare         | HIPAA & patient data protection         | Resolved because patient data <b>mathematically never exists in plaintext</b> on the server.                 |
| Legal              | Attorney-client privilege               | Resolved as <b>asymmetric encryption</b> ensures only <b>authorised key-holders</b> can decrypt documents.   |
| Government         | Data sovereignty & classification       | Resolved via the ability to deploy across <b>7 distinct infrastructure targets</b> , ensuring local control. |

# Competitive Positioning

# Deployment Location is Irrelevant

Because the server mathematically **never sees plaintext**, your deployment location is a matter of IT preference, not a security vulnerability.

# Integration Timeline & Next Steps

Integration Hub: [sgit.ai](https://sgit.ai) | CLI: `pip install sgit-ai` | Web: [send.sgraph.ai](https://send.sgraph.ai)
