

The Cryptographic Infrastructure for Human and AI Collaboration.

Expanding beyond secure file transfer to build the agentic communication plane.

A Zero-Knowledge Primitives Platform.

SG/Send is a zero-knowledge encrypted platform for data sharing, sharing, collaboration, and agentic communication. We compete on absolute simplicity, an unbeatable speed of innovation, and expanding use cases far beyond what the legacy market serves.

01

Frictionless Utility

Usage-based billing, zero tracking, deploy everywhere.

02

Agentic Advantage

Shipped faster than traditional teams via proprietary AI development workflows.

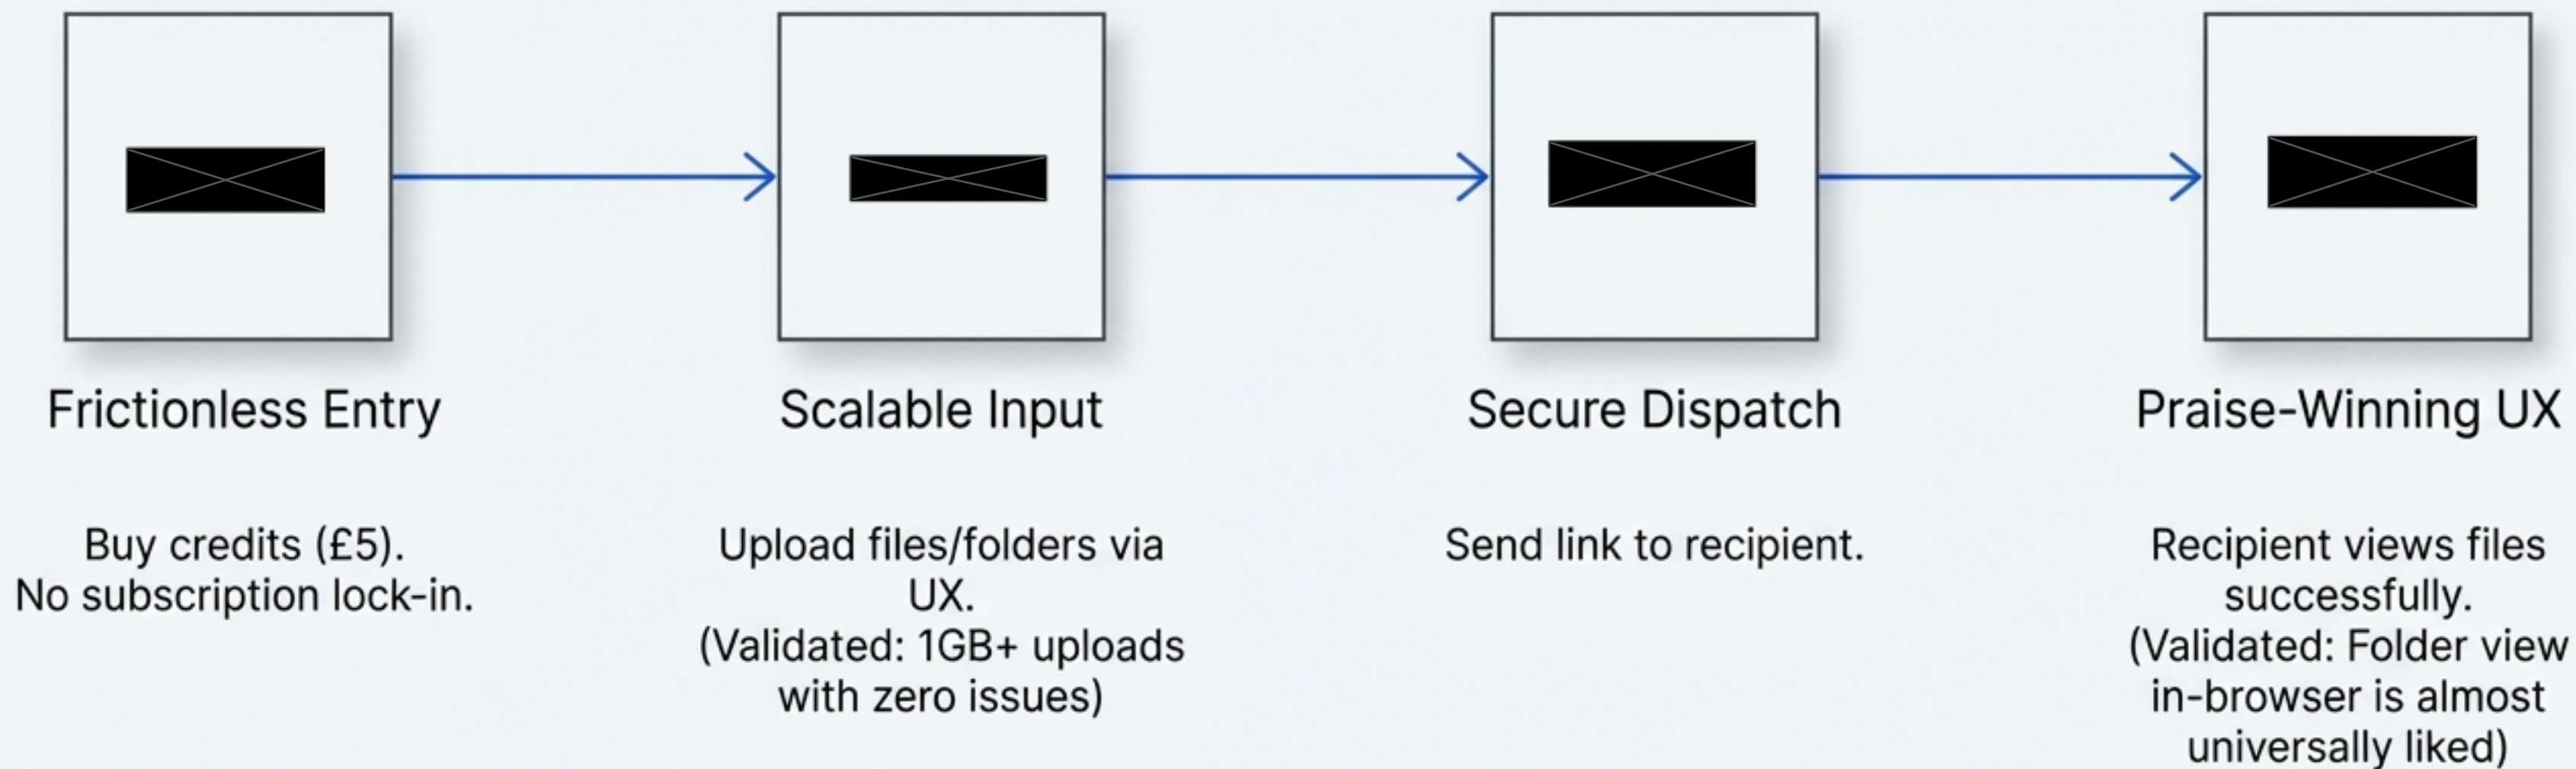

03

Viral Distribution

Built-in exponential loops where every recipient becomes a potential customer.

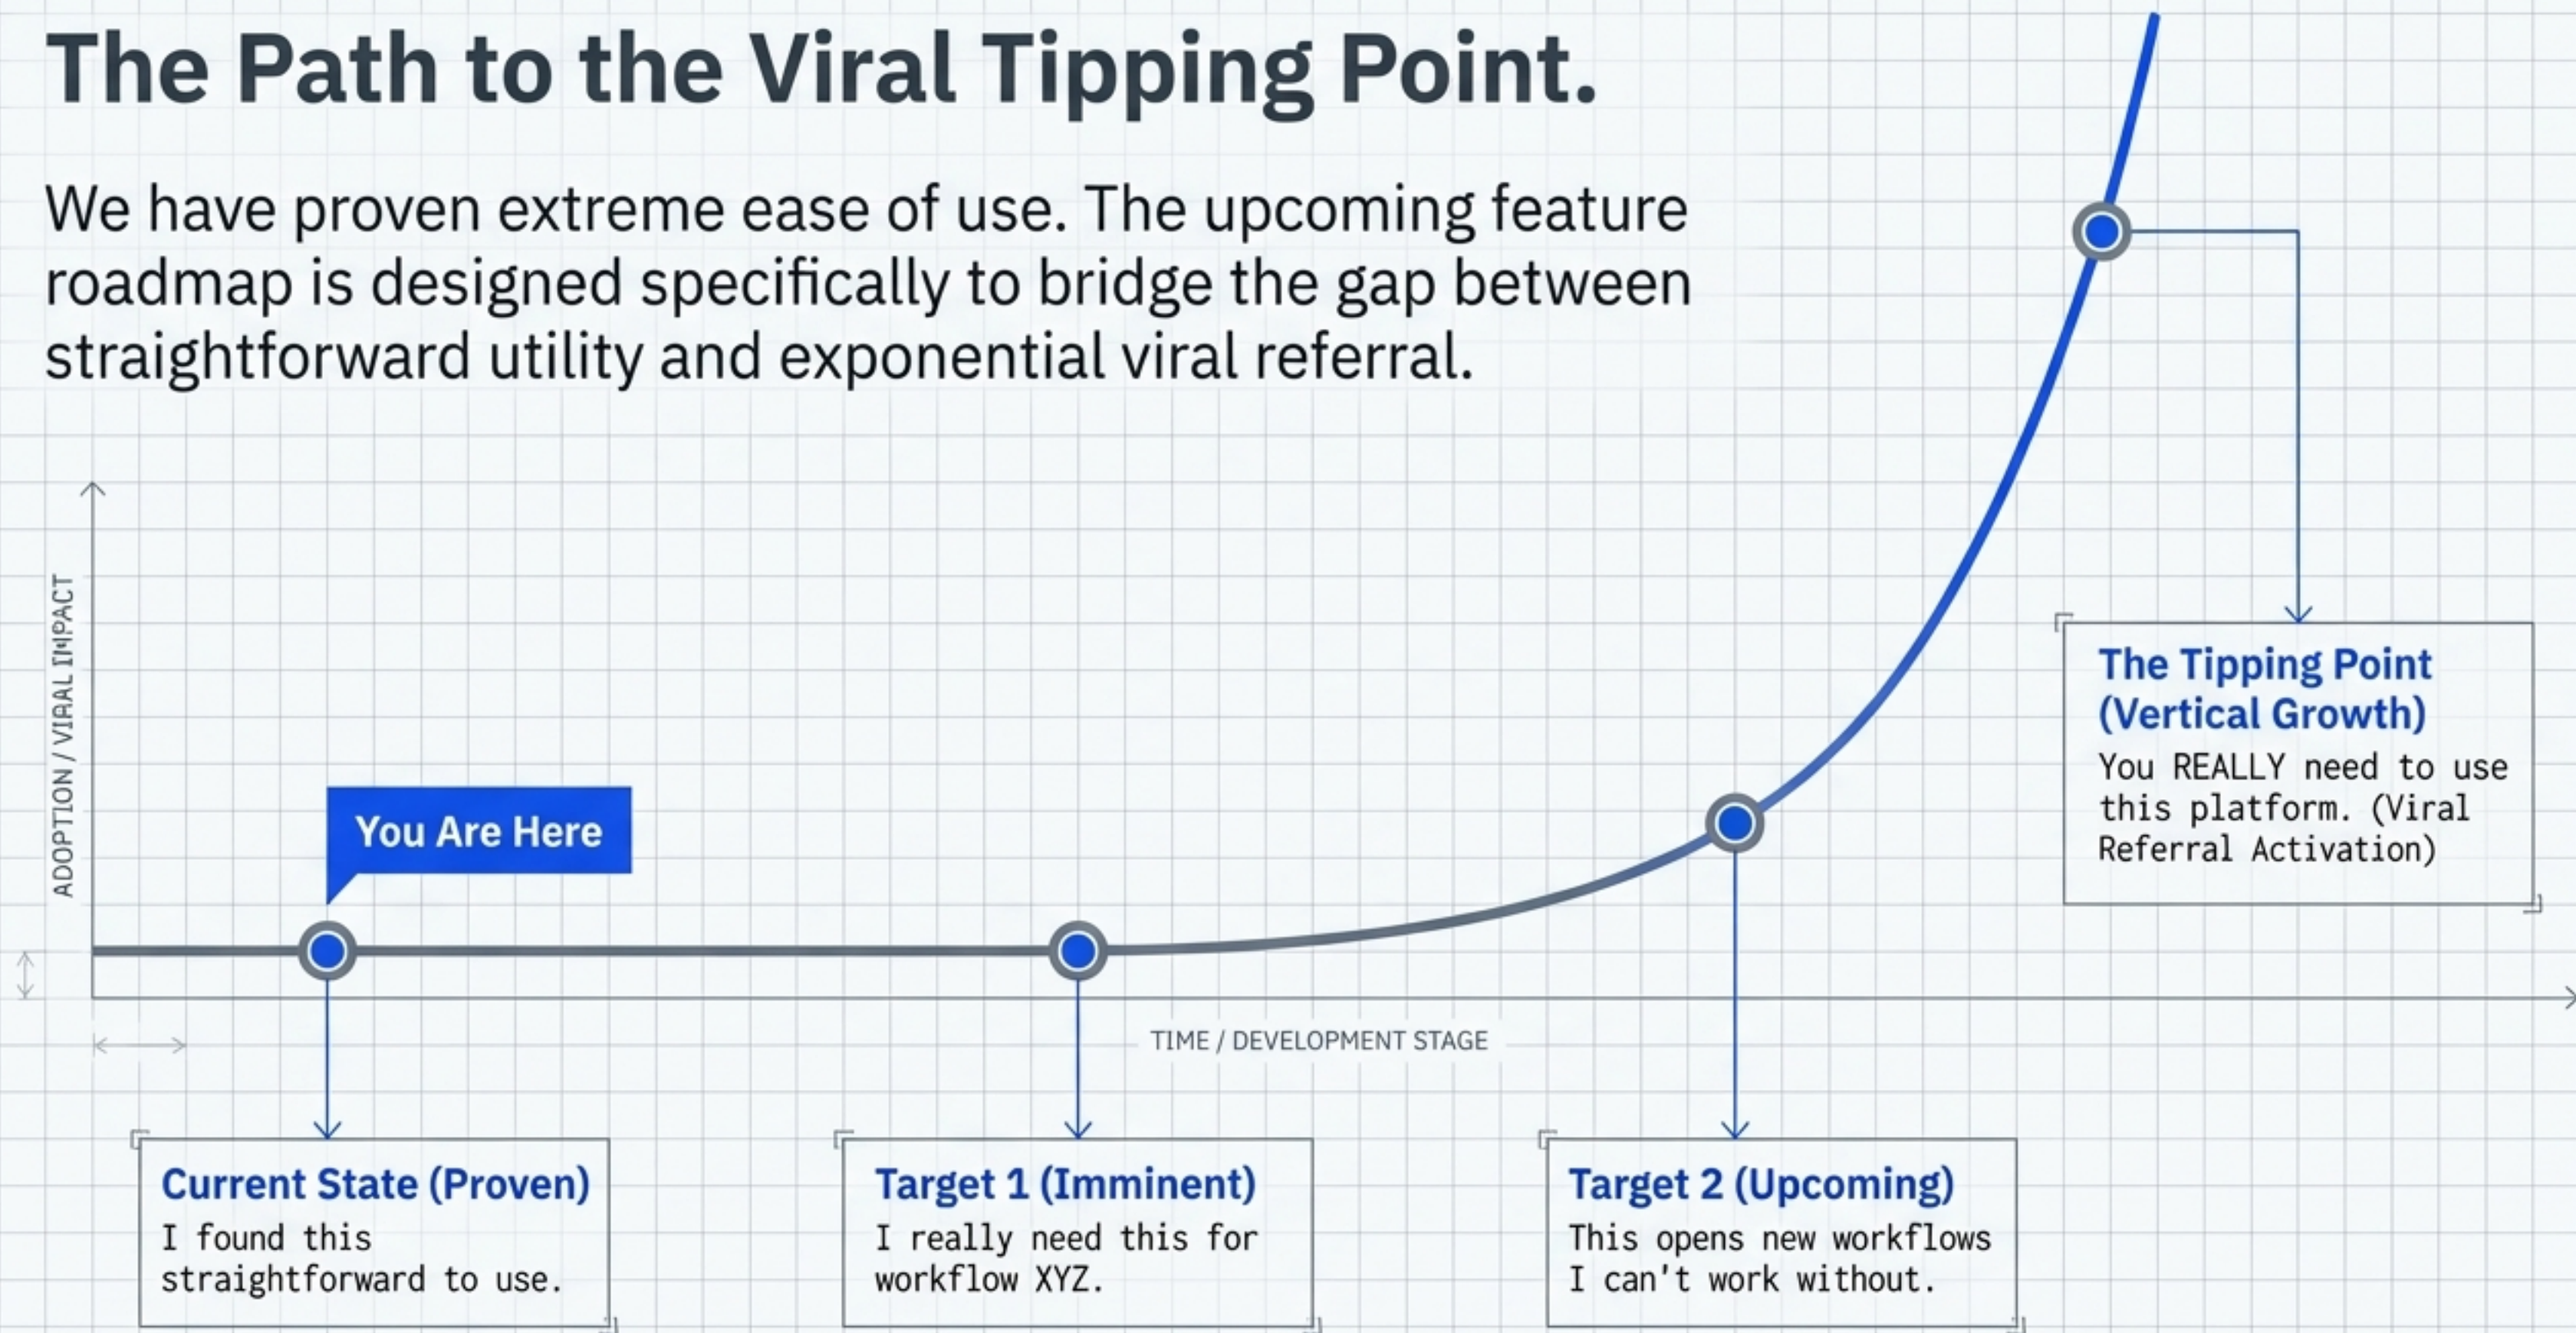

A Proven MVP Built on Frictionless Exchange

Customers are actively completing the full end-to-end purchasing and usage workflow on the live product today.

The Path to the Viral Tipping Point.

We have proven extreme ease of use. The upcoming feature roadmap is designed specifically to bridge the gap between straightforward utility and exponential viral referral.

The Market is Stagnant.

Our Wedge is Frictionless Subversion.

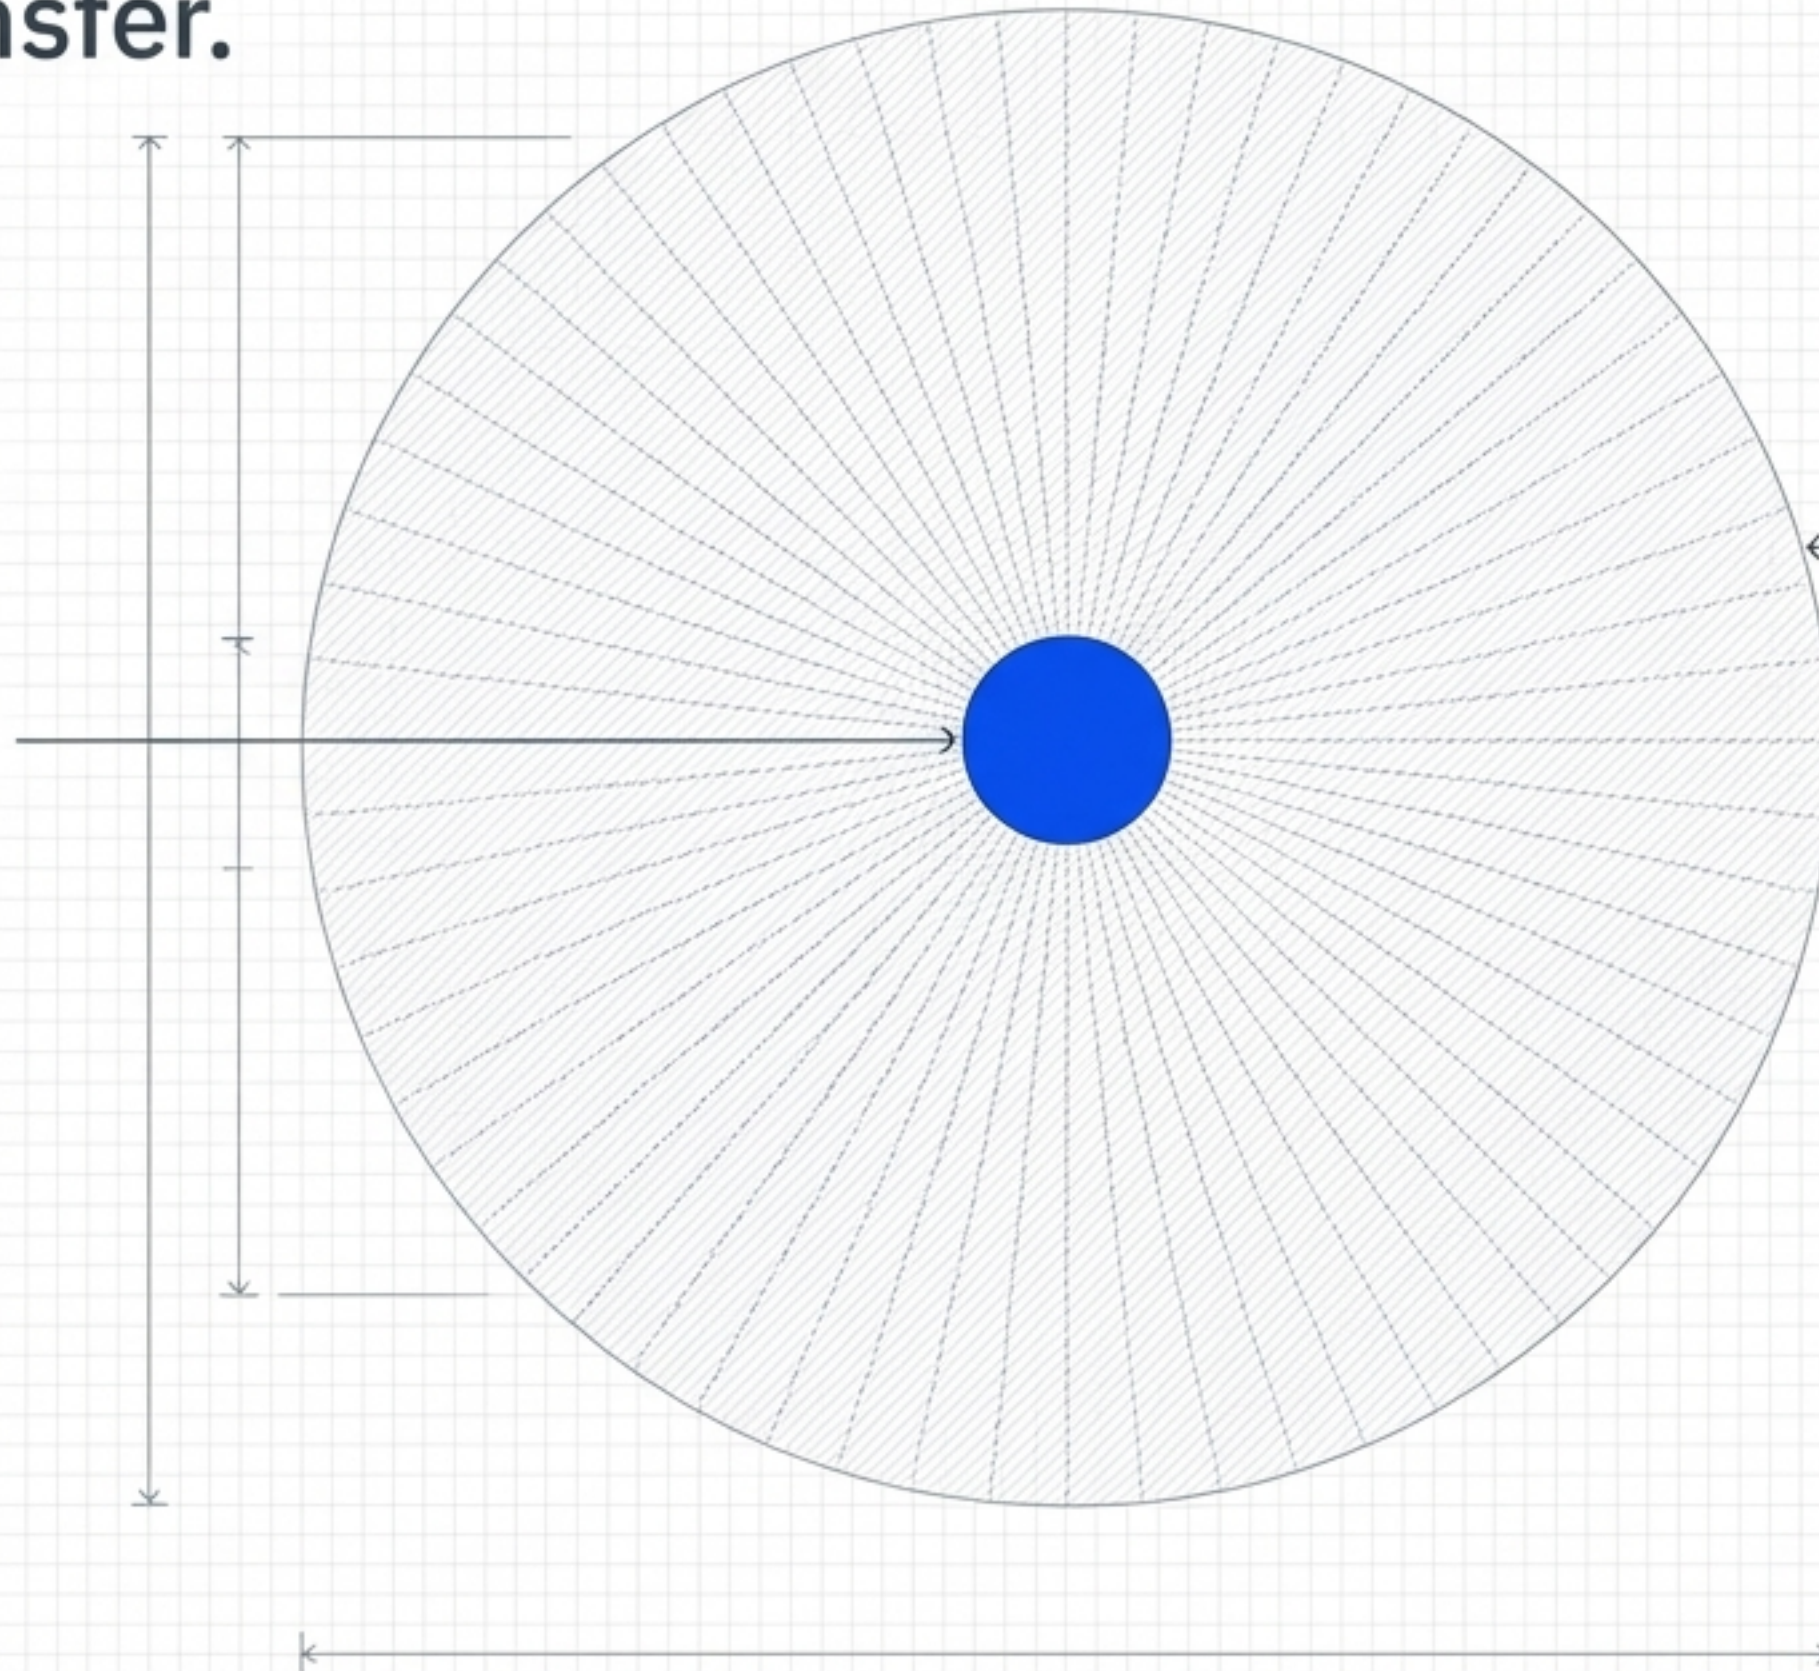

Secure file sharing has not innovated in years. Security alone is not a competitive wedge; absolute simplicity and profound respect for the user is.

	 Legacy Providers	 SG/Send Wedge
User Experience	Limited workflows, poor collaboration	Absolute simplicity, deploy everywhere (browser, CLI, mobile).
Security Architecture	Server-side access (provider can read data)	True zero-knowledge client-side encryption.
Pricing Model	Subscription fatigue (£10/month minimum)	Usage-based billing (pay only for what you use).
Privacy Stance	Extensive cookies, data mining	Zero tracking (6-sentence privacy policy, zero cookies).
AI Readiness	Built exclusively for human input	Native API & Agentic integration.

Expanding the Category Beyond Human Transfer.

The initial hypothesis was to build a more private version of existing platforms. The real business opportunity lies in expanding the technology into an entirely new plane that current markets cannot serve.

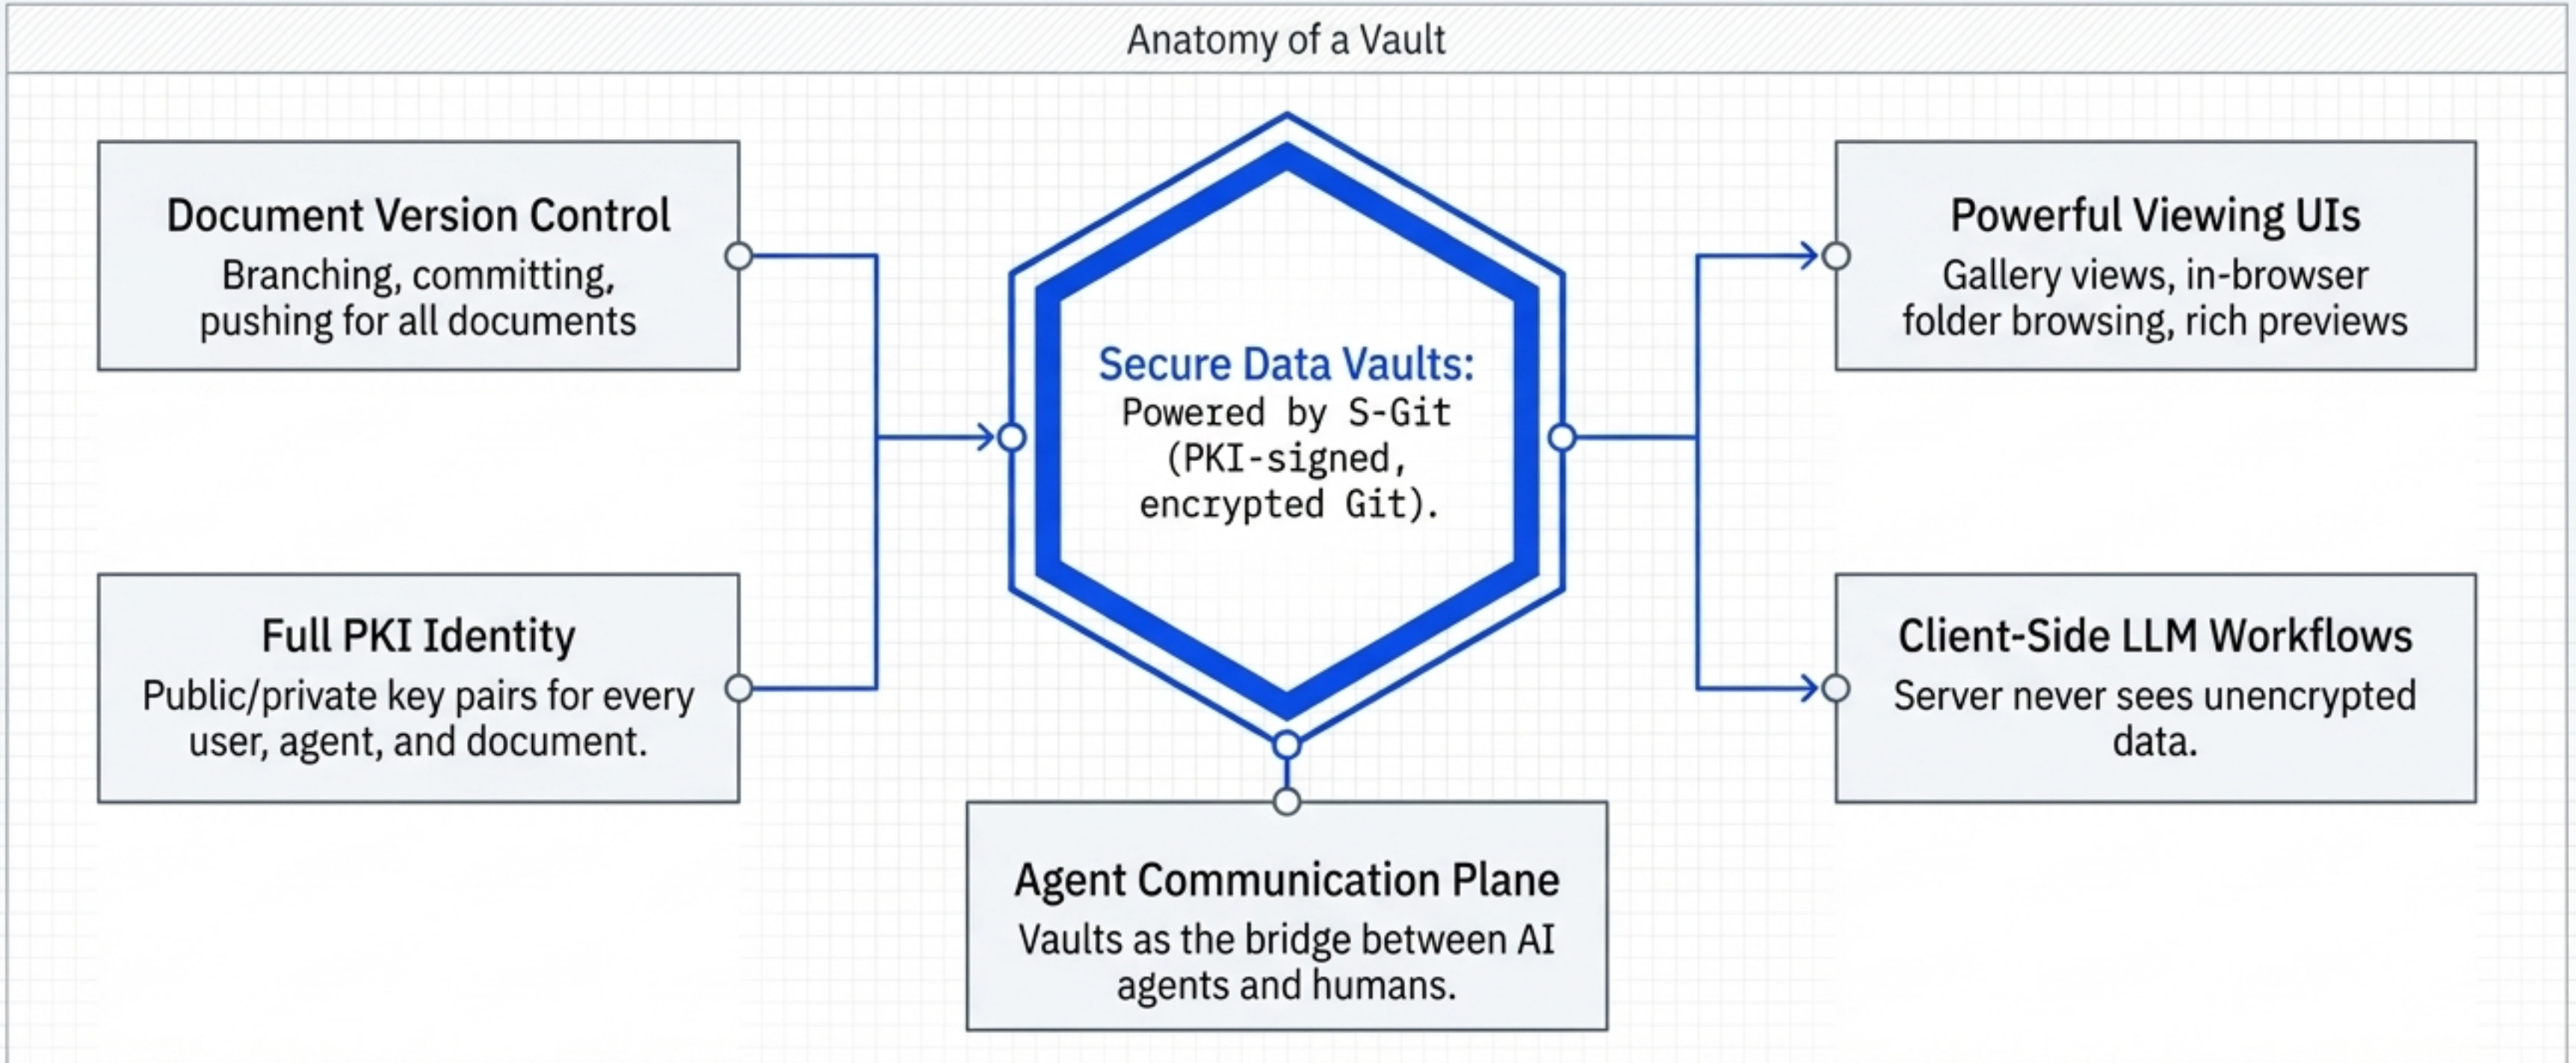

The Wedge: Secure, zero-knowledge file sharing.

The Category: The cryptographic communication plane for Agent-to-Agent and Agent-to-Human workflows.

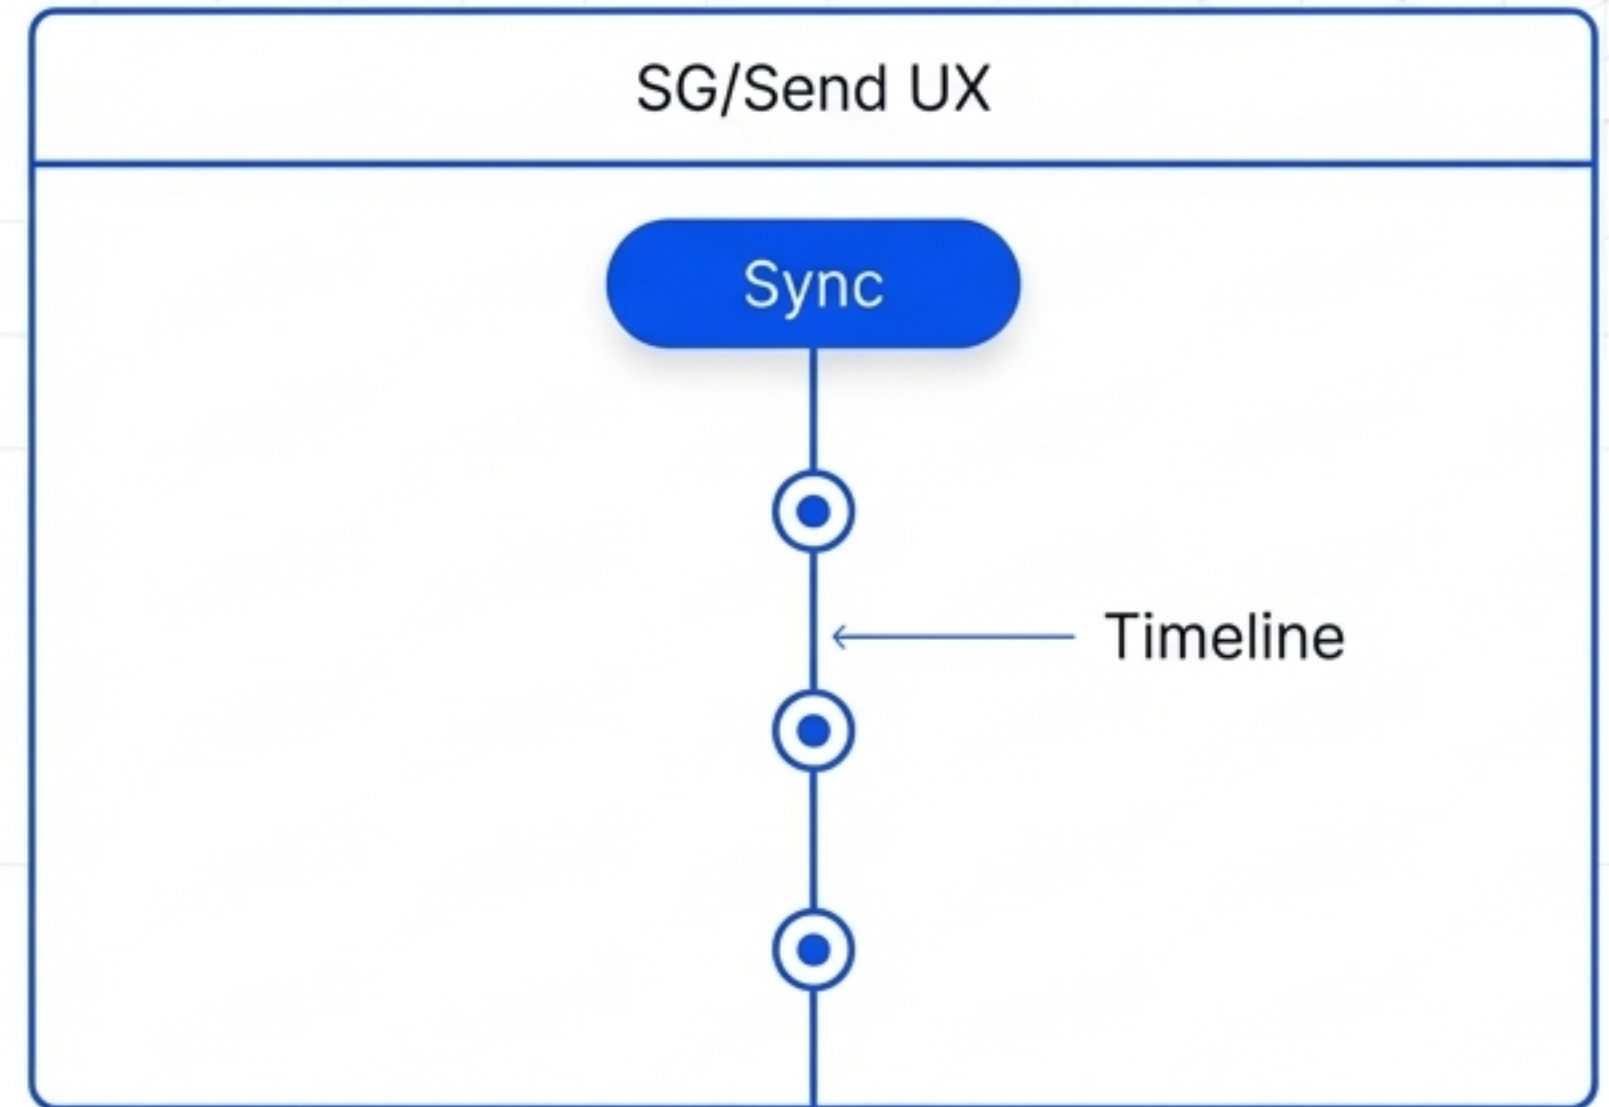

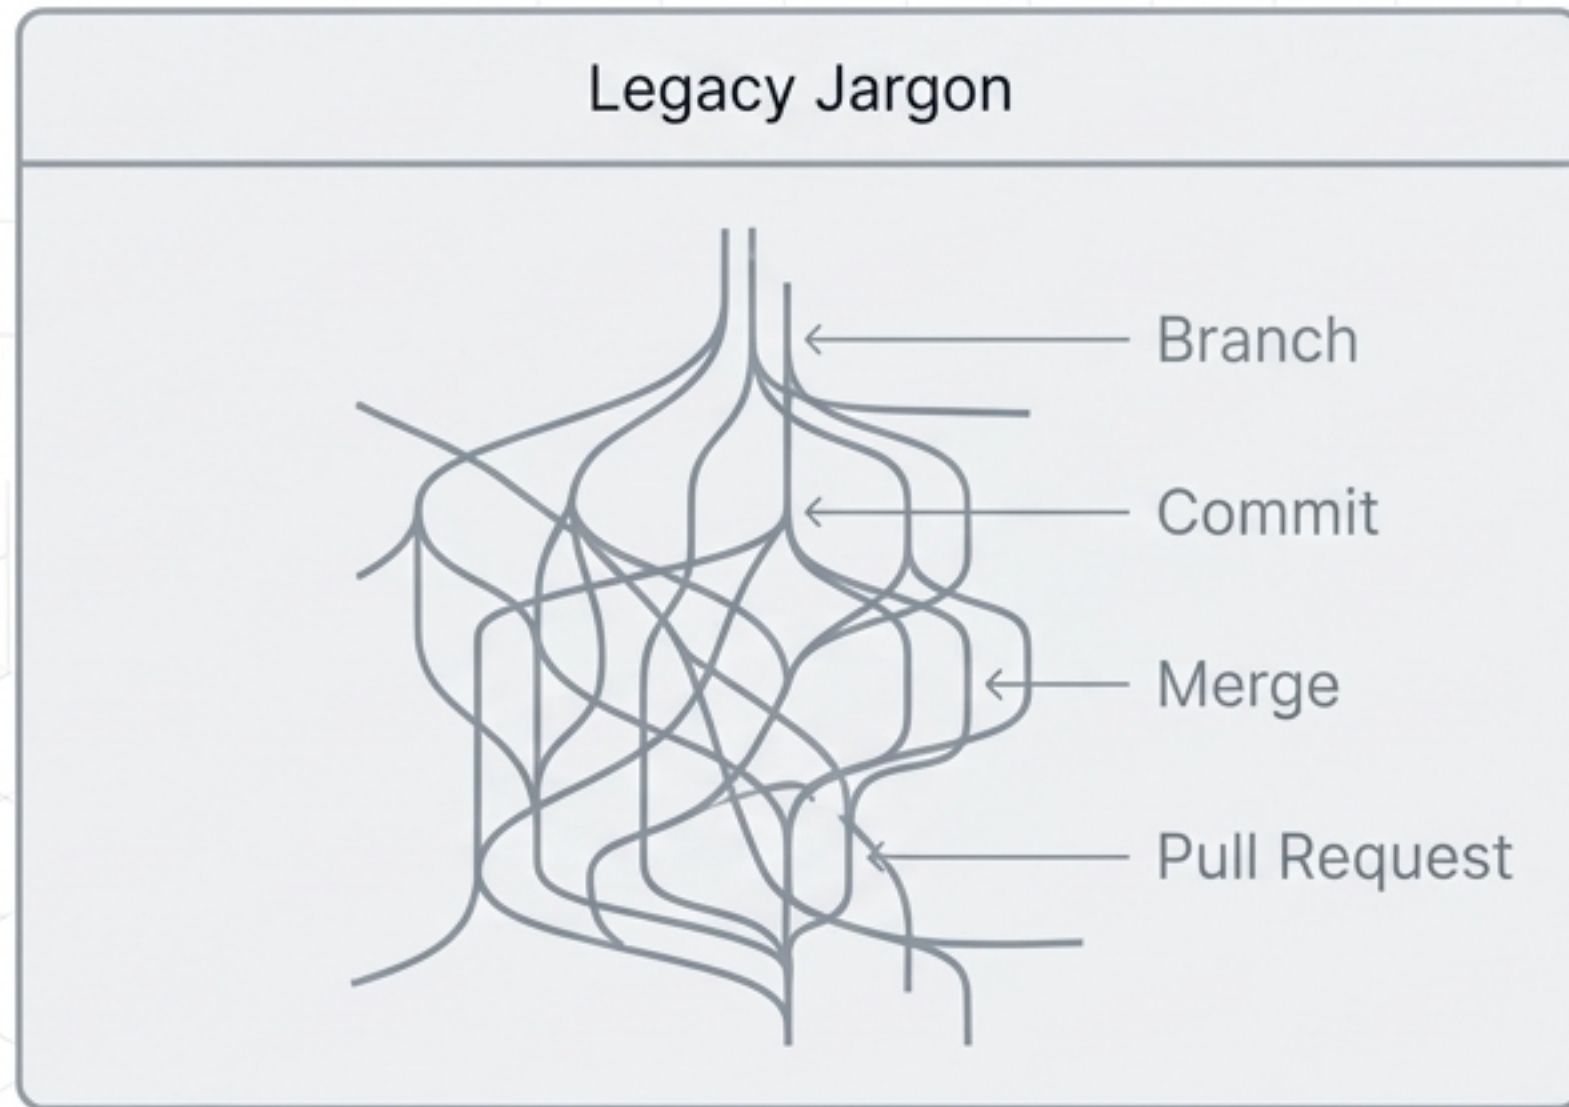

The Architecture of the Next Evolution.

These six feature sets have working MVPs and will launch in the coming weeks. Every feature is use-case driven, ensuring technology serves the workflow.

Developer-Grade Version Control, Human-Grade UX.

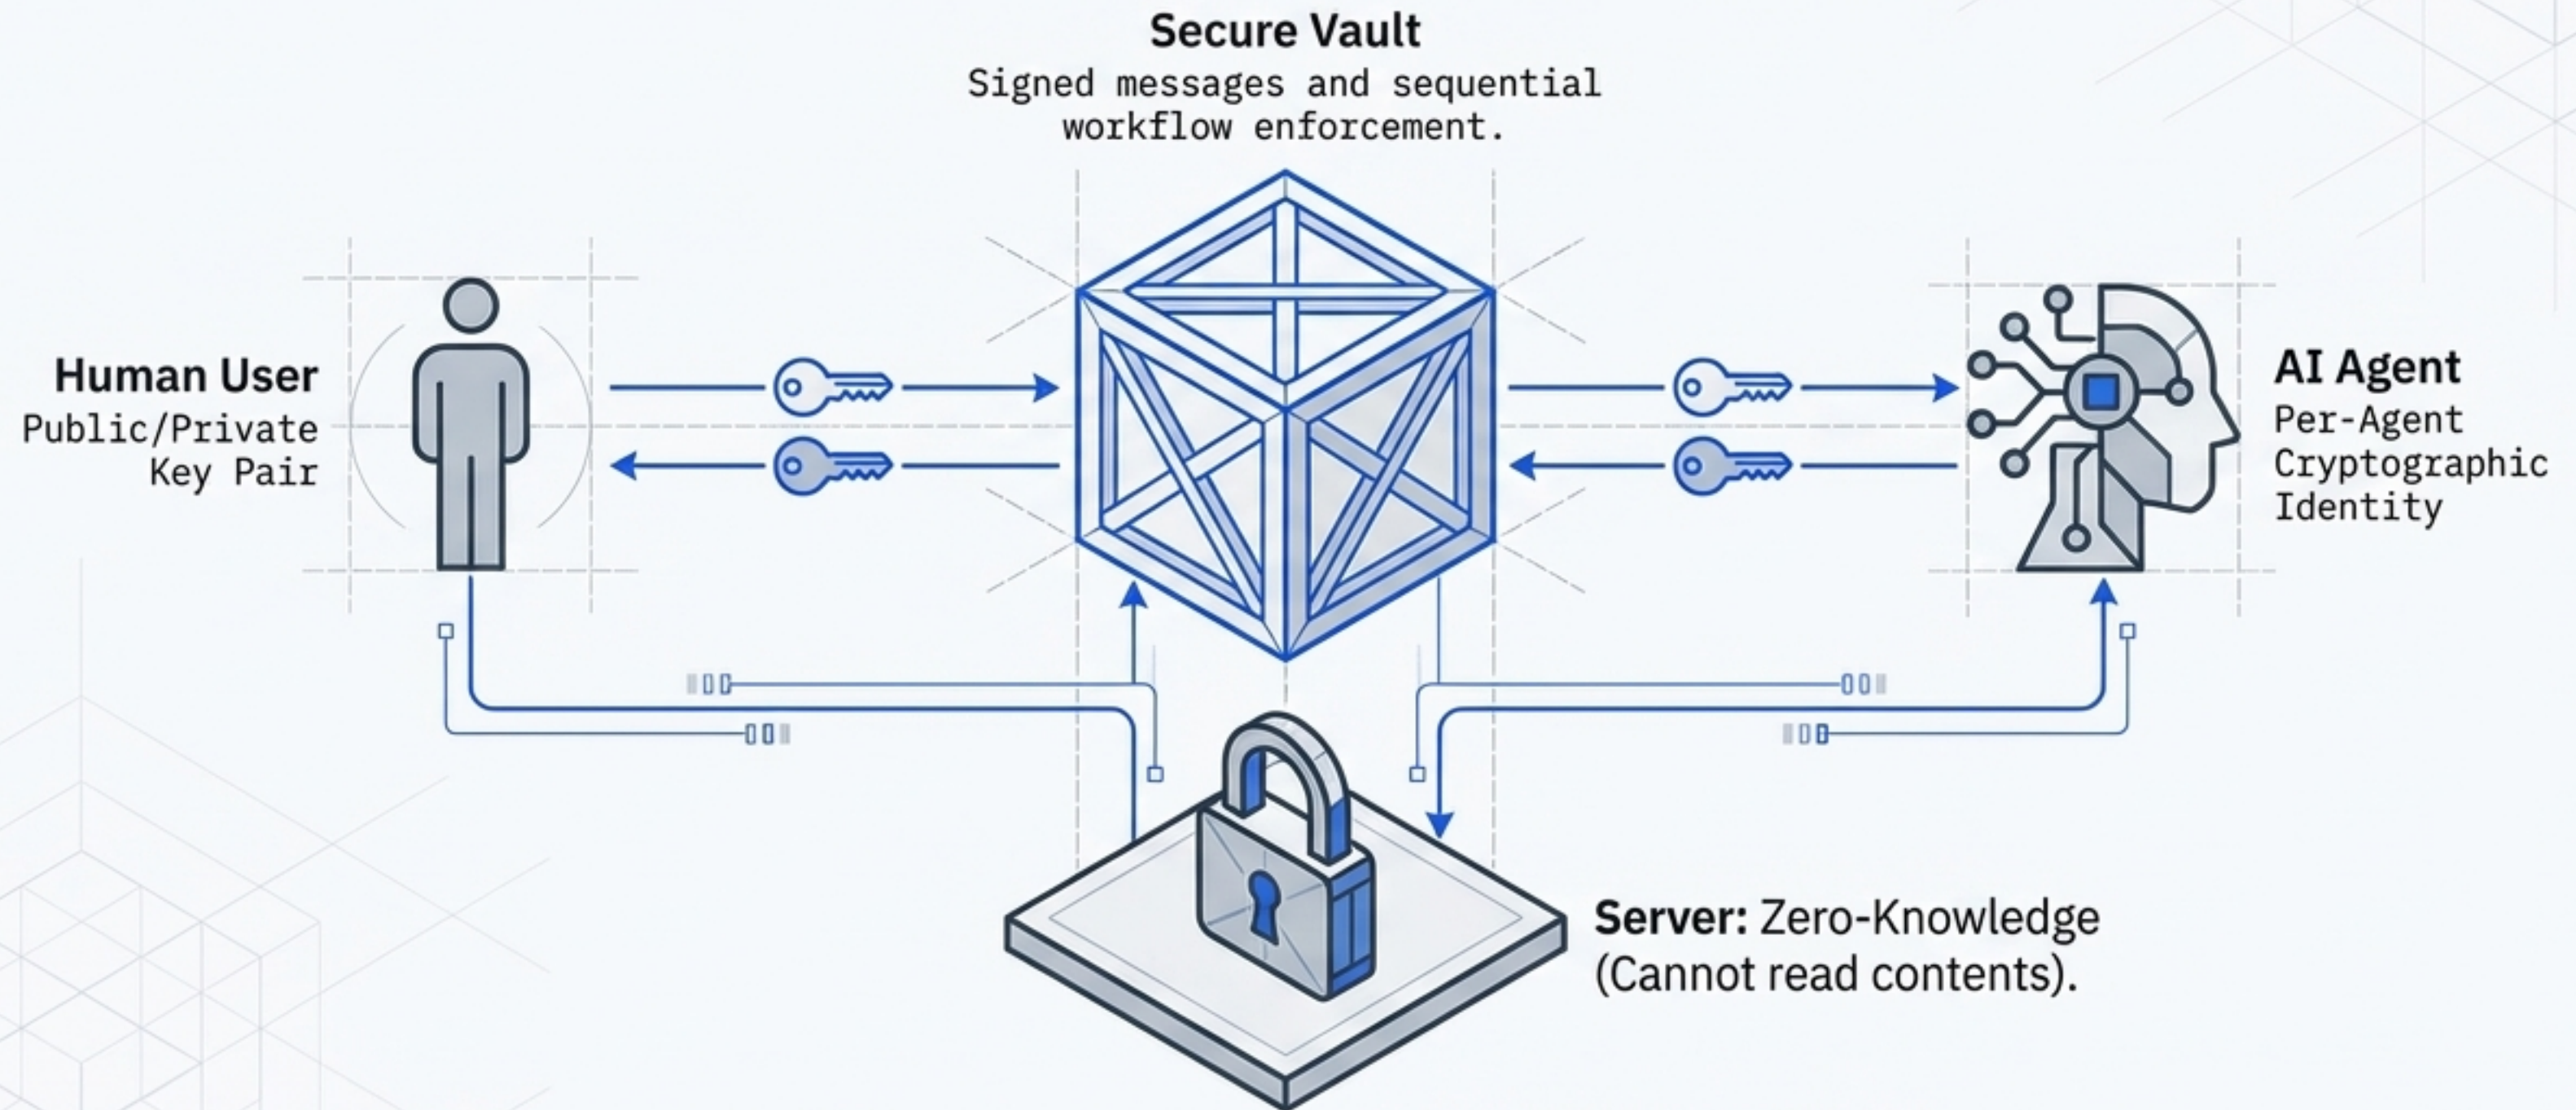

We are bringing the power of Git to everyone. True version control for documents and vaults without the cognitive load.

System: S-Git | Encryption: PKI-Signed

The Infrastructure for the Agentic Era.

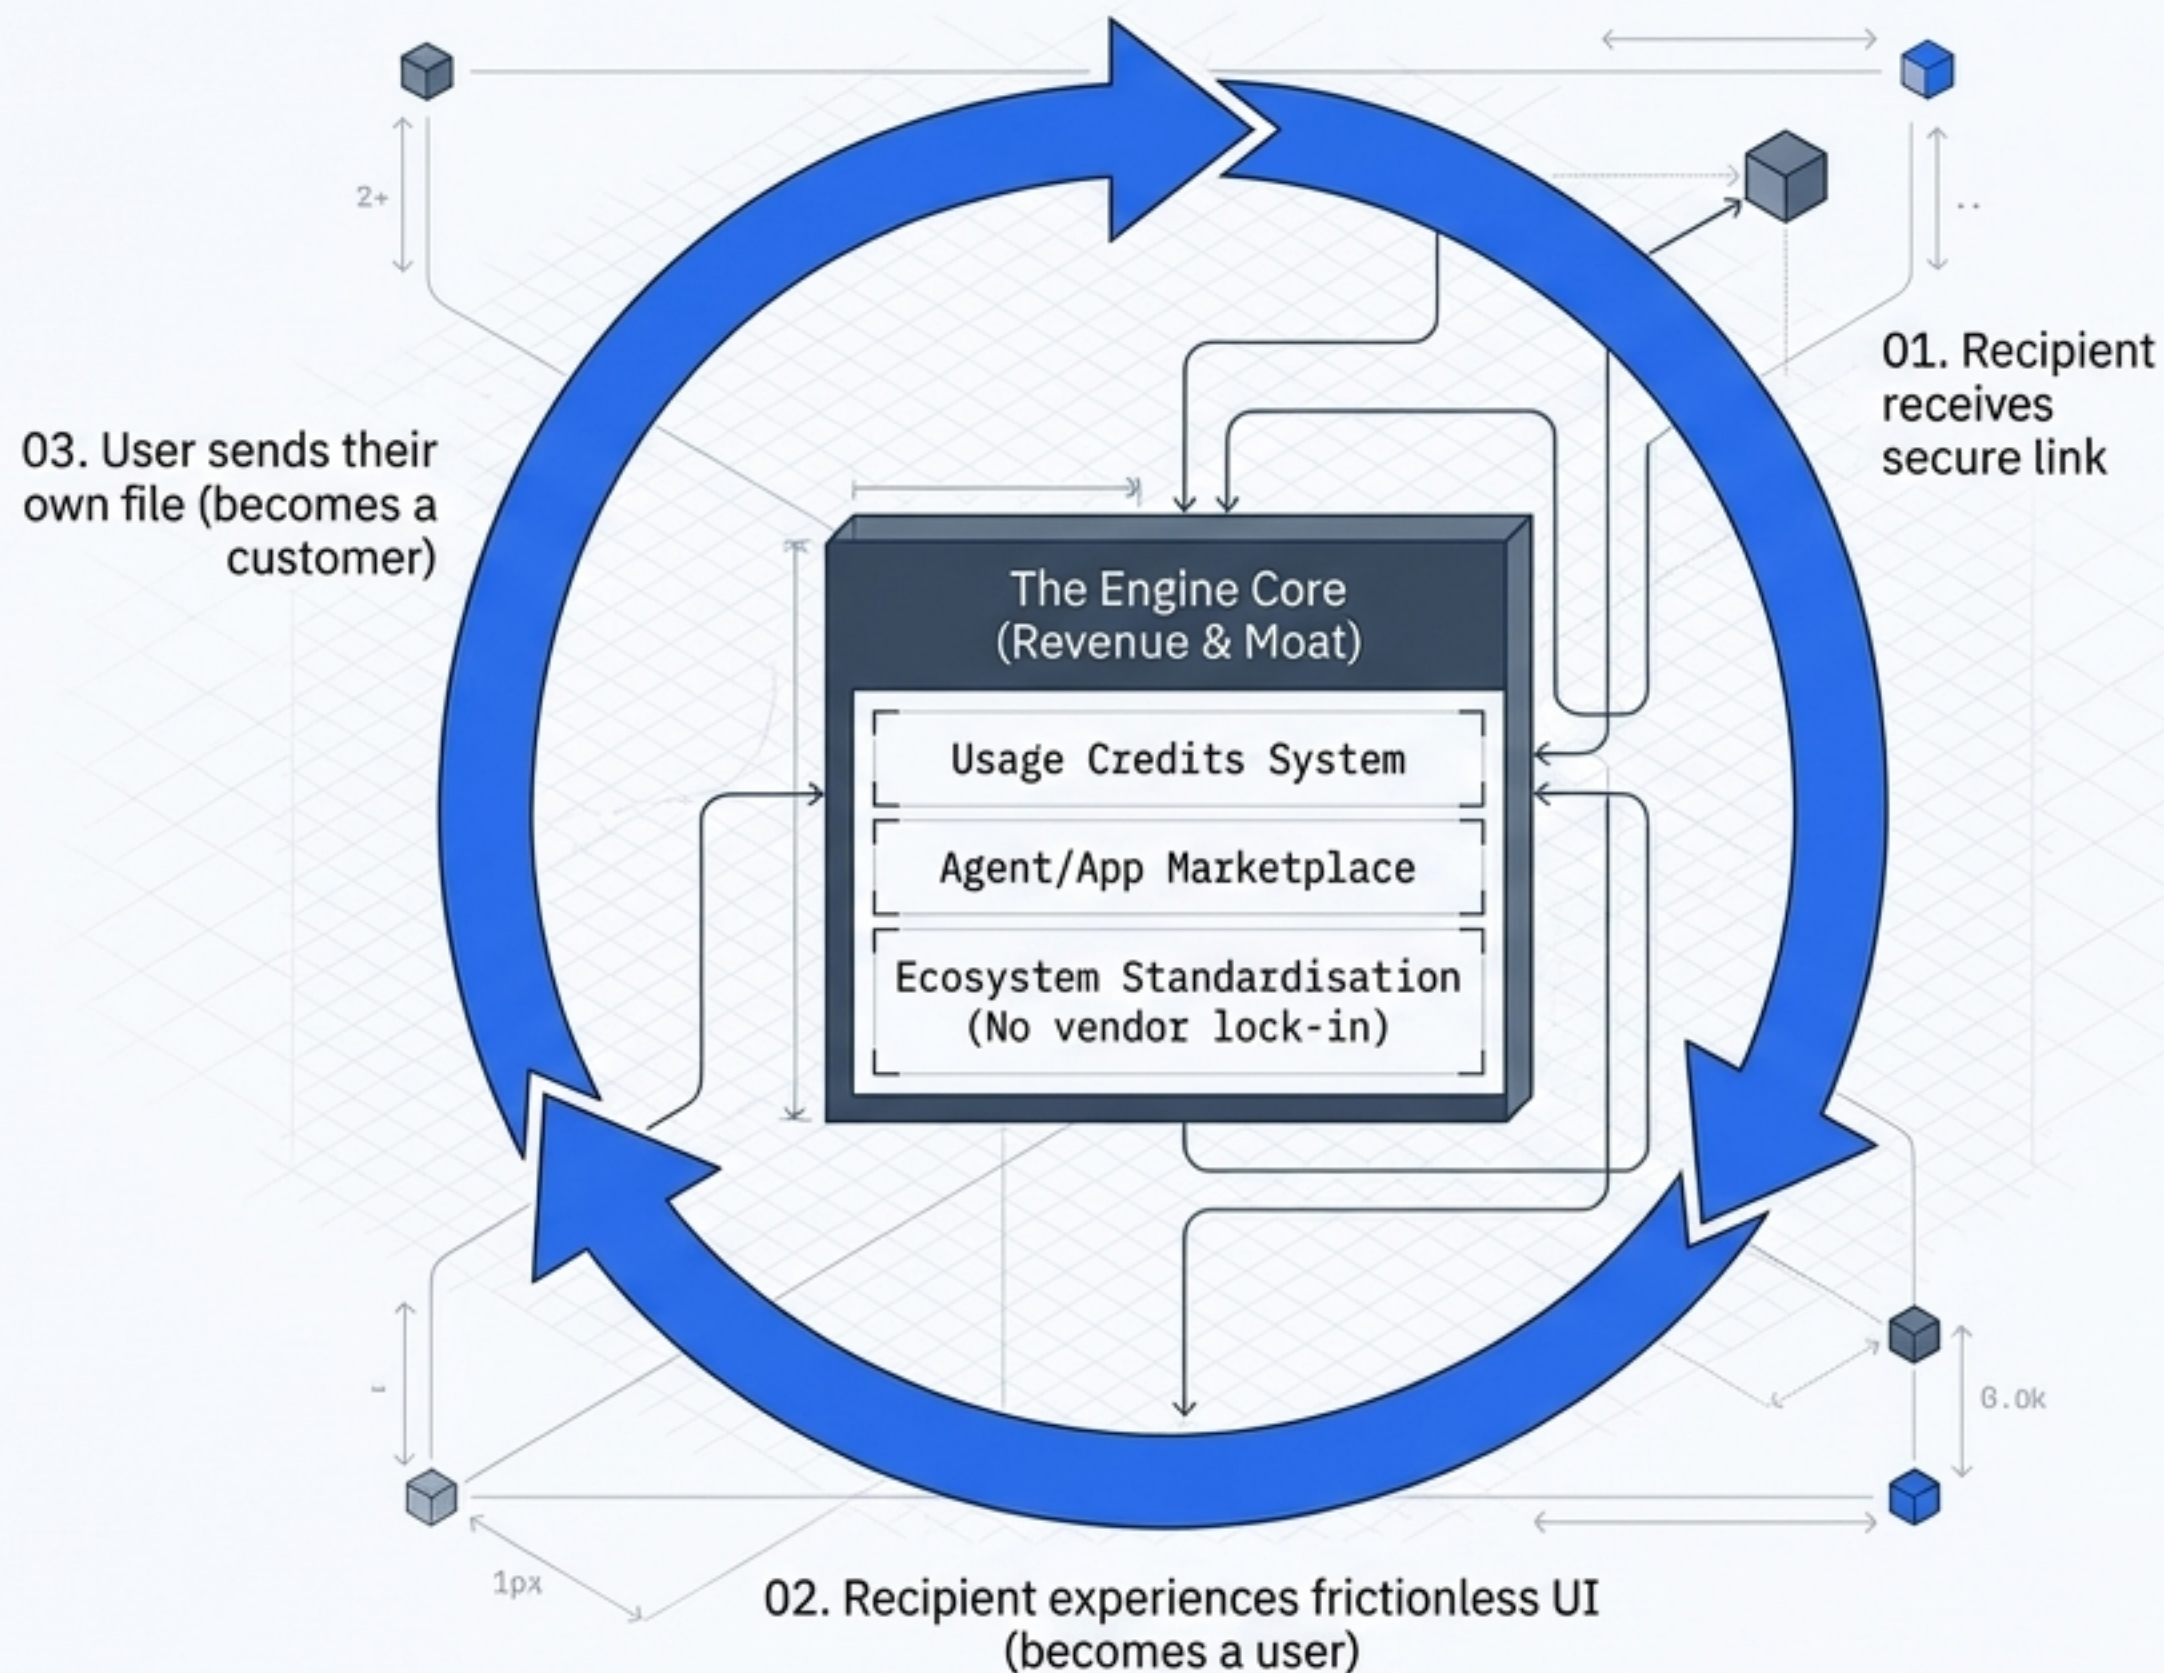

AI integration that doesn't compromise privacy. Processing happens entirely client-side or via user-provided API tokens. The central server is structurally blind to the workflow.

System: Zero-Knowledge Architecture | Encryption: End-to-End, PKI-Signed

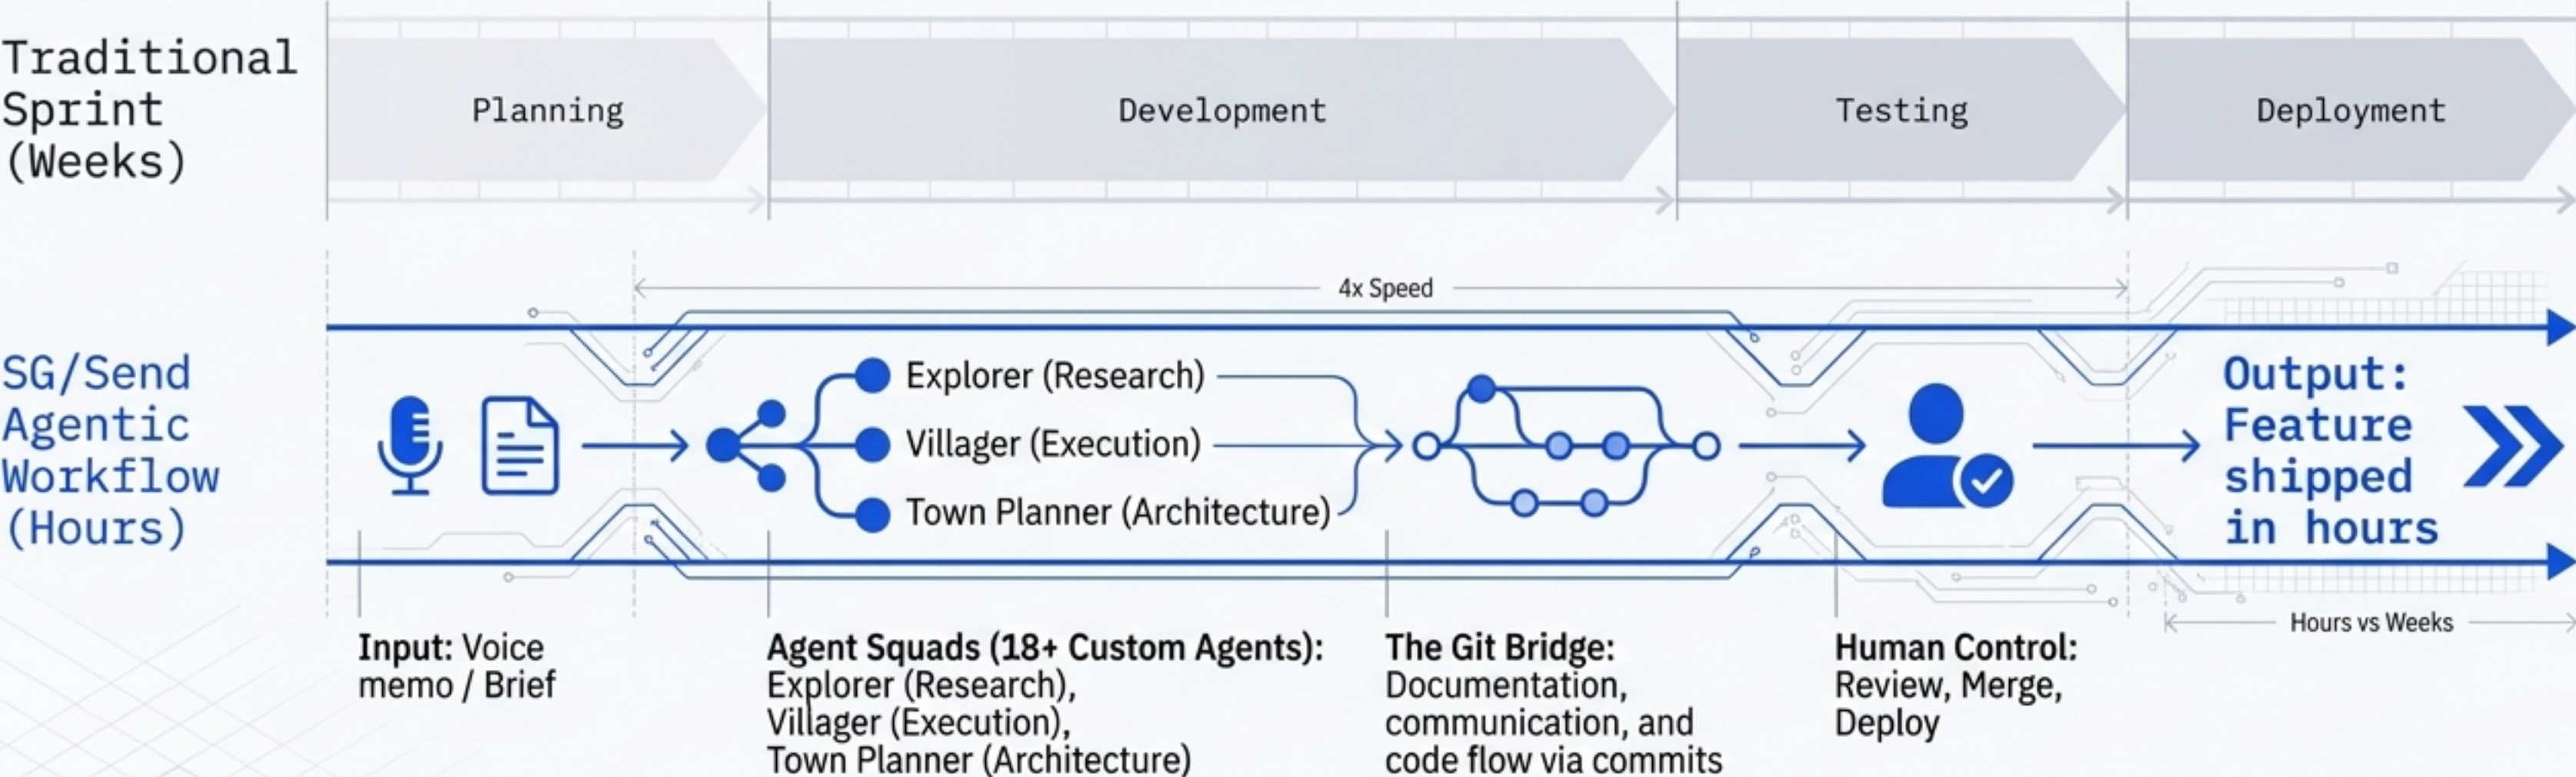

Built-In Distribution and Sovereign Monetisation

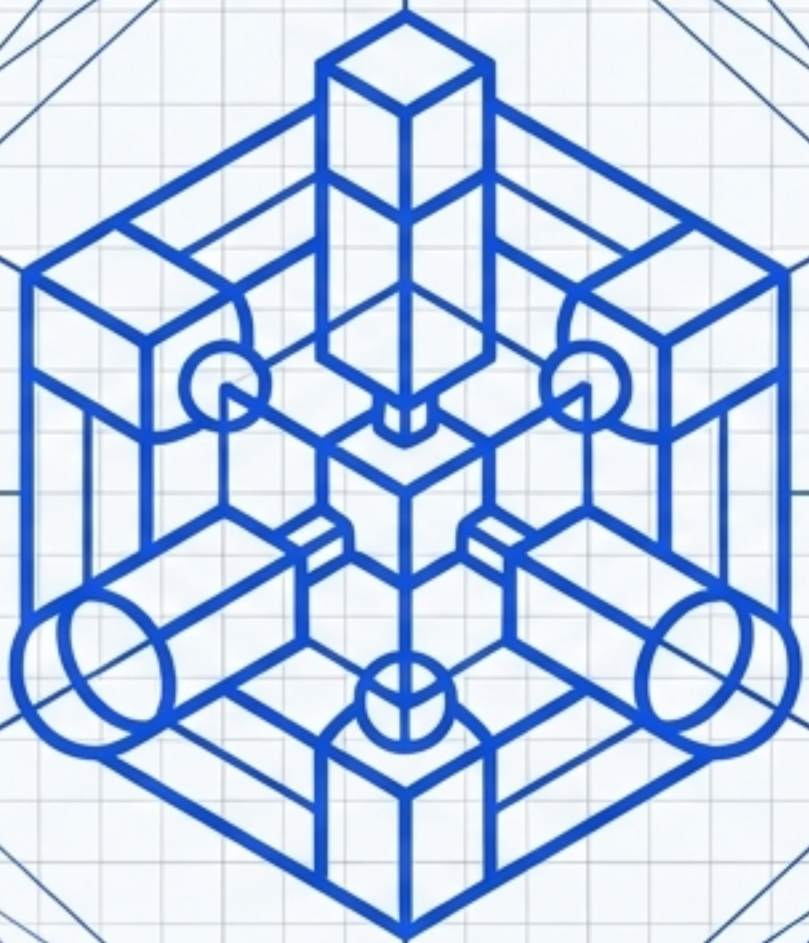

The distribution mechanism is the product itself. The open-source foundation guarantees customer sovereignty while generating distinct revenue streams.

Our Unfair Advantage: Development Velocity.

The speed at which we ship is a compounding competitive moat. A small team outpaces established players on feature breadth while maintaining absolute quality.

The Standard for Secure Collaboration.

We are not just building a better file-sharing tool.
We are deploying the foundational cryptographic
infrastructure for the human-and-AI future.
Frictionless for users, invisible to servers,
and built to scale exponentially.
