

SG/Send: Direction & Milestones

For Review & Alignment | 20 February 2026

From: Dinis Cruz, SG/Send
To: Investor Group

Status: v0.4.17 Live
Strategy: Validation & Velocity

Constructing the Infrastructure You Requested

Investor Conversation

Analysis & Research

Direction Document

Purpose

Following our conversation, we are confirming alignment on direction before the next demo. We are building.

We are building what you need, not what we assume. Your feedback now ensures the next demo focuses purely on execution.

The Ask

Action Required:

- ☒ 1. Does this match expectations?
- ☒ 2. Are we missing critical elements?
- ☒ 3. Is the priority order correct?

What Works Today: v0.4.17

Core Features:

- **No App:** Sender and Recipient use standard browsers.
- **No Account:** Frictionless entry.
- **Standard Crypto:** AES-256-GCM encryption happens in the browser before upload.

“

“Foolproof — like Google search.
The correct implementation.”

— Senior Security Professional (25 years exp).

The Security Architecture: A Zero-Knowledge Promise

Keys never leave the device.

Even with full access to our infrastructure, all anyone finds is encrypted bytes.

The Strategic Pivot: Three Steps to Velocity

1. Eliminate Friction

From "Share a Key"
to "Send to Alice"

2. Automate LLM Integration

"Claude, send this
securely"

3. Monetize Dedicated Instances

Your firm. Your domain.
Your region.

Moving from a standalone tool to integrated infrastructure.

Step 1: Solving the 'Key Exchange' Friction

Current Friction

Two Channels Required

New Workflow (PKI)

One Link. One Click.

Technical Implementation: Native Web Crypto API (ECDH P-256). No external libraries. >97% browser coverage.

New Workflow to key in
Zero-Knowledge preserved.

Benefit: No key to share.
Zero-Knowledge preserved.

Step 2: “Claude, Send This Securely”

The Workflow:

- **CLI Tool** (sg_send): For LLMs with shell access.
- **MCP Server**: For Claude Desktop Integration.

Security Stance:

We are not adding a trust boundary. You already trust Claude with the draft. We just automate the delivery.

Note: OpenAI GPT Actions rejected due to server-side plaintext requirements.

Step 3: Dedicated Instances & Monetisation

Managed

Hosted by SG/Send. Custom domain. Custom branding.

Self-Hosted

Deployed in YOUR AWS/GCP account. Total control.

Ephemeral

Spin up for a specific deal. Tear down when closed.

Value Prop: Isolation from other customers. Your branding, your region.

Infrastructure Economics: Scale to Zero

The Market Gap

	Email	WeTransfer	Data Rooms	SG/Send
End-to-End Encrypted	 No C2EE, Server Access.			
Server Cannot Read Files				
No Install Required		 Limited Free Tier, Server Access.		
Open Source / Verifiable				
Cost Efficiency			 High Cost, Complex Setup	

"Most solutions fail on multiple dimensions... or they're expensive." — Reviewer

Technology Choices as Security Features

Traction & Validation

Done
(Feb 2026)

- ☒ End-to-end MVP Live
- ☒ Independent Security Review (No critical findings)
- ☒ Investor Briefing sent via SG/Send
- ☒ "Signal for the web" tagline coined organically
- ☒ PKI + LLM Research complete

Next

- ☐ PKI Demo
- ☐ Claude Integration
- ☐ Multi-region deployment

The Next Meeting: A Live Demonstration

We prefer to show, not tell.

1. PKI in-browser: Key generation and decryption.
2. Claude Integration: Live document dispatch from an LLM.
3. Your Instance: A live, branded version running on custom domain.

Discussion & Direction

1. Does the PKI -> LLM -> Instance order match your needs?

2. Which deployment model fits you (Managed vs. Self-Hosted)?

3. First use case: Deal docs or Credentials?

4. Is the Claude workflow a daily driver or nice-to-have?

5. What is the minimum feature set for conversion?
