

The Operational Manifesto

Why SGraph Send treats every incident like a crisis

Most teams operate in two distinct modes

We decided to close the gap

“Most teams wait for a crisis to take security seriously. We decided not to wait.”

We reject the distinction between “routine” and “critical.” Security is a discipline practised daily, not a feature toggled during emergencies.

P3 is P1: Luck vs Weakness

The Standard View:

- P1: Critical. Drop everything.
- P3: Minor. Log it, fix later.

The SGraph View:

- We treat every P3 as a P1.
- Reason: The systemic weakness is identical.

The only difference is luck.

Analysing the Union of Possible Damage

When we ask 'What happened?', the answer is small.

When we ask 'What could have happened?', the answer is often terrifying.

We do not fix the symptom; **we fix the capability for the error to exist.**

Every role is a security sensor

In most organisations, security is a silo. At SGraph, every role—from architecture to UX—has an explicit incident response section in their job definition.

The 'How Come?' Framework

<u>Developer</u>	How come our tests did not catch this?
<u>Tester</u>	How come our test matrix had this gap?
<u>Architect</u>	How come our architecture allowed this?
<u>Doc Team</u>	How come this runbook was out of date?
<u>DPO</u>	Did we know where all personal data was?

This is not blame. It is systematic improvement to prevent the entire class of issue.

The 5x Multiplier

Incidents are the single best time to fix structural debt.

- 1. Arguments Disappear:** Priority debates vanish.
- 2. Alignment Materialises:** Single shared goal.
- 3. Help Arrives:** Resources become available.
- 4. Focus Replaces Debate:** Two weeks of work happens in two days.

We deliberately recreate the crisis condition

We do not wait for disasters to get this level of focus. We run monthly tabletop simulations to build muscle memory.

Simulate before acting

Rule: Never take your first action in production.

Acting without modelling creates new problems. Every response—technical fixes, communications, escalations—is simulated first. The cost of a 10-minute simulation is low; the cost of a mistake is high.

The Preparation Spectrum

Goal: Move every incident type rightward

Practice makes real incidents look like exercises.

Protecting the Zero-Knowledge Guarantee

SGraph Send is Zero-Knowledge. Our incident handling philosophy exists to protect this cryptographic promise. Every “minor” incident is an opportunity to verify that no gap exists in this architecture.

When the worst happens, the architecture holds

We practise responding to total infrastructure compromise.
Because of our design and practice, the attacker finds only:

Encrypted blobs they
cannot decrypt.

Hashed IPs they
cannot reverse.

Metadata that does
not identify content.

This outcome is not an accident. It is architecture, verified through practice.

Calm, Methodical Precision

Because we treat P3s like P1s, and because we simulate constantly, real incidents do not cause panic. They look like the exercises we run every month.

We replace the chaos of Crisis Mode with the precision of Practised Discipline.

**Security is not a
feature you add.
It is a discipline
you practise.**

At SGraph Send, we **practise** every day—so that when it matters, we are ready.
