

# GRAPHS OF GLORY

A Story of Semantic Alignment, Compatibility, and the End of "String" Theory.

**When your text is just a string, everything falls apart.**

BASED ON THE SCREENPLAY. RUNTIME: 117 MINS (SIMULATED). DISCLAIMER: NO LLMS WERE HARMED IN THE MAKING OF THIS DECK. SEVERAL WERE MILDLY CONFUSED.

# THE INCITING INCIDENT: THE STRING PROBLEM

USER PERCEPTION (THE SURFACE)

SYSTEM REALITY (THE BLINDNESS)

If meaning comes from connectivity, text (as a string) has no meaning.

# SCENE 2: THE SANDWICH METAPHOR

"What if I told you this sandwich was just a string to me? What if I couldn't see the bread, the lettuce, the mysterious brown meat?" – Dino

# THE DANGER OF SEMANTIC SPRAWL

**Context:** Dino asks an LLM to “extract meaning” without constraints.

**Result:** The LLM functions like a cleaner who just moves the mess to a different room.

**Key Insight:** You can't just extract. You need a contract.

# THE SOLUTION: ONTOLOGY & TAXONOMY (O&T)

1. Define the Ontology (What exists).
2. Define the Taxonomy (How it relates).
3. The prompt is not just a request; it is a constraint.

**"O&T FIRST, ALEX! THIS CHANGES EVERYTHING!"**

# ACT TWO: THE FIVE LAYERS OF TRUTH

The Problem: We describe systems in five disconnected languages and assume they agree.  
The Goal: Compatibility Through Connectivity. We must extract a graph from *each* layer to compare them.

# REALITY IS FRACTAL

**DR. QUADRANT:** Four levels, perfectly nested. Context, Container, Component, Code.

**DINO:** Levels should EMERGE from TRAVERSAL! A node doesn't know what level it's at! The level is a VIEW, not a PROPERTY!

**Key Takeaway:** Architecture shouldn't be about fitting reality into static boxes. It should be about traversing connections seamlessly.

# THE BOOTSTRAP PARADOX

Dino has designed a beautiful machine (Extractors, Comparison Engines) but cannot afford the time to code it from scratch. How do you verify the design of the tool you need to build?

**THE PIVOT: WIZARD OF OZ PROTOTYPING**

*Director's Cut / Technical Blueprint*

## ACT THREE: SIMULATION AS SPECIFICATION

*The Prompt = The Spec. The Model = The Temporary Code.*

This allows immediate validation of the workflow. Discover what's broken before writing a **single line of parser code.**

# THE COMPATIBILITY ENGINE ARCHITECTURE

We are not measuring **CORRECTNESS** (Does it crash?).  
We are measuring **ALIGNMENT** (Does the Code match the Design?).

# VALIDATION: THE 'INVISIBLE' BUG

GRAPH A: FROM TEXT DOCUMENTATION

```
> Rule Check: Traffic must pass through Gateway
> Graph A Path: COMPLIANT
> Graph B Path: DIVERGES (Direct connection found)
> Status: INCOMPATIBLE
```

GRAPH B: FROM ARCHITECTURE DIAGRAM

The Engine detected a security flaw that humans missed because it compared the MEANING across layers.

# TESTING UNDERSTANDING

## DOES THE SYSTEM WORK THE WAY THE ARCHITECT *\*THINKS\** IT WORKS?

### TRADITIONAL TESTING

Does function return X? ☒

Is latency < 100ms? ☒

Unit / Integration / E2E. ☒

### COMPATIBILITY TESTING

Does diagram match text?

Does code match diagram?

SHIFTING FOCUS  
FROM CORRECTNESS  
TO ALIGNMENT

Alignment / Semantics / Truth.

"We've been describing systems in different languages and just HOPING they agree." — Petra

# IMPLEMENTATION: START SIMPLE

1. **START SMALL:** Take one text file and one diagram.
2. **VALIDATE WORKFLOW:** Use an LLM to extract graphs from both.
3. **CHECK ALIGNMENT:** Do they match?
4. **SCALE UP:** Add complexity only after the workflow is proven.

"The graph never stops. It just waits for you to explore further."

# THE CAST (ARCHETYPES)

## DINO: "THE VISIONARY"

Driven by the  
need for  
semantic truth.

← CORE  
DRIVE

## MARCUS: "THE SKEPTIC"

Provides  
constraints  
(and metaphors).

## PETRA: "THE DOCUMENTARIAN"

The bridge  
between  
legacy knowledge  
and new tools.

## CLAUDE: "THE ENGINE"

The agent that  
bridges the  
bootstrap gap.

← EXECUTION

"It takes all four to move from String Theory to Graph Glory."

# NEXT STEPS

- Define your Ontology & Taxonomy.
- Treat diagrams as code.
- Check for alignment, not just bugs.

## Epilogue Status

DINO:  
Still sending voice memos.

MARCUS:  
Still wants sandwich credit.

YOU:  
Ready to build.

Meaning through connectivity. All the way down.
