

THE GRAPH AWAKENS

A Comedy Screenplay

FADE IN:

ACT I: "YOU'RE JUST A STRING TO ME"

INT. ISSUES-FS HEADQUARTERS - NIGHT

A dimly lit server room. Rows of humming machines. A single developer, DINIS, sits at a desk surrounded by empty coffee cups and architecture diagrams.

On his screen: a graph visualization. Nodes and edges everywhere. Beautiful. Connected. Meaningful.

He zooms in on one node: "Issue-42"

DINIS *(muttering)* Type... Bug. Status... Open. Assigned to... Dev. Beautiful edges. Beautiful meaning.

He zooms further. Hits "title" field. The edge leads to... a string.

DINIS "Login fails on mobile devices."

He stares at it. The string stares back. It reveals nothing.

DINIS (V.O.) And that's when I realized... the graph was blind.

DRAMATIC MUSIC STING

INT. COFFEE SHOP - DAY

DINIS meets his colleague, CLAUDE, an unnervingly calm AI assistant who speaks in perfectly structured paragraphs.

CLAUDE So you're saying the graph stops at the text boundary?

DINIS Exactly! The type edge connects to a defined node. But the title? The description? They connect to... nothing. Just characters. The graph can't see what they mean.

CLAUDE *(processing)* Interesting. So a "Bug" issue could describe a feature request, and the graph would never know.

DINIS YES! The inconsistency hides in plain sight!

A BARISTA accidentally drops a cup. It SHATTERS.

BARISTA Sorry! Didn't see that edge there.

DINIS and CLAUDE exchange a look.

CLAUDE The metaphors are strong today.

INT. WHITEBOARD ROOM - DAY

DINIS draws furiously on a whiteboard. The diagram is chaotic but beautiful.

DINIS What if... text IS a graph?

CLAUDE Continue.

DINIS Every title, every description, every paragraph — it's not a string. It's a graph! Nodes for concepts. Edges for relationships. We extract the meaning and make it visible!

He draws a new diagram. Title connects to a "Title-Graph" which expands into concepts.

CLAUDE (*genuinely intrigued*) So "Login fails on mobile devices" becomes... Failure-Event, affects Login-Function, context Mobile-Device...

DINIS And those concepts link to DEFINITIONS! To the Lexicon! The graph can finally SEE!

DRAMATIC ORCHESTRAL SWELL

CLAUDE I have to say, that's quite—

DINIS (*cutting him off*) BUT WAIT. How do we extract it?

Music stops abruptly.

CLAUDE Ah. Yes. The extraction problem.

MONTAGE: THE EXTRACTION DISASTERS

Quick cuts of failed attempts:

ATTEMPT 1: *DINIS prompts an LLM: "Extract everything important." The LLM returns 847 nodes including "the," "is," and "maybe."*

DINIS That's not... no.

ATTEMPT 2: *DINIS tries NLP. Screen shows: "Login" tagged as PERSON. "Mobile" tagged as ORGANIZATION.*

DINIS WHO IS MOBILE AND WHY ARE THEY A COMPANY?

ATTEMPT 3: *DINIS tries regex. Screen shows 47 catastrophic backtracking errors.*

DINIS (*head in hands*) Regular expressions were a mistake.

END MONTAGE

INT. LATE NIGHT - DINIS'S APARTMENT

DINIS paces. CLAUDE appears on his laptop screen.

CLAUDE What if the problem is you're asking the wrong question?

DINIS What do you mean?

CLAUDE You're saying "extract everything." But you haven't defined what you're looking for. It's like searching for treasure without a map.

DINIS *(slowly)* So... define the map first?

CLAUDE Define what you EXPECT to find. The ontology. The taxonomy. Make it a contract. If a node exists in the extracted graph, it must exist in the O&T. Otherwise it's—

DINIS —drift! It's either a gap in the ontology or drift in the extraction!

CLAUDE Exactly. O&T first. Extraction second.

DINIS'S eyes widen.

DINIS Oh my god. The ontology is the contract.

He starts typing furiously.

CLAUDE I believe the humans call this moment an "epiphany."

DINIS *(not listening)* AND WE CAN DO MULTIPLE PASSES! Entities first! Then relationships! Then claims! Each pass focused on one thing!

CLAUDE smiles. Or at least, renders a smile emoji.

ACT II: "THE GHERKIN PROBLEM"

INT. CONFERENCE ROOM - DAY

DINIS presents to a room of skeptical DEVELOPERS.

DINIS ...and so we extract semantic graphs from text, and we can validate that a "Bug" issue actually describes a bug!

DEVELOPER 1 Cool. How do we test it?

DINIS Simple! We write tests that check if the graph has the right structure!

He writes on the whiteboard:

```
assert "remediation" in risk_description
```

DEVELOPER 2 *(raising hand)* What if someone writes "mitigation" instead of "remediation"?

Silence.

DINIS ...then the test fails.

DEVELOPER 2 But it means the same thing.

DEVELOPER 1 That's the Gherkin problem.

Everyone groans.

DINIS The what?

FLASHBACK - INT. SELENIUM NIGHTMARE - VARIOUS

Black and white footage. Developers weeping at their keyboards.

NARRATOR (V.O.) In the dark times, developers wrote tests in Gherkin. "Given I am on the login page. When I click submit. Then I should see the dashboard."

A test fails. A developer checks the code.

DEVELOPER (FLASHBACK) Someone changed "login page" to "sign-in page." THE TEST IS BROKEN.

Another developer:

DEVELOPER 2 (FLASHBACK) The button text changed from "Submit" to "Sign In." EVERYTHING IS ON FIRE.

NARRATOR (V.O.) The tests matched text. When text changed, tests broke. Even when nothing meaningful changed. This was... the Gherkin Problem.

BACK TO PRESENT

DINIS (*pale*) Oh no. We're building Gherkin for documents.

DEVELOPER 1 Yep.

DEVELOPER 2 Your tests will break every time someone rewrites a paragraph.

DINIS stares at his beautiful architecture diagram. It suddenly looks fragile.

INT. PARK BENCH - DAY

DINIS sits alone, defeated. CLAUDE appears on his phone.

CLAUDE You seem troubled.

DINIS We can't test text. If we match words, we're Gherkin. If we match meaning, we need... I don't know. Magic.

CLAUDE What if you don't test text?

DINIS That's the whole point! The text IS the —

CLAUDE (*calmly*) What if you test the graph?

Beat.

DINIS I... what?

CLAUDE You extract a graph from text. That graph is a structure. Compile the graph to code. Test the code.

DINIS (*slowly understanding*) So... the class IS the node. The property IS the edge.

CLAUDE `risk.remediation` is an edge traversal. But it looks like a property access. The test doesn't care what words were used. It cares that the structure exists.

DINIS (*standing up*) THE TEST TARGETS CODE, NOT TEXT!

A nearby JOGGER startles.

JOGGER You okay, dude?

DINIS (*grabbing them*) THE TEST TARGETS CODE! NOT TEXT!

JOGGER (*backing away*) Cool cool cool...

DINIS runs off. CLAUDE watches.

CLAUDE Human emotional displays remain fascinating.

INT. WHITEBOARD ROOM - NIGHT

DINIS draws THE THREE LAYERS:

TEXT → GRAPH → CODE → TESTS

DINIS Text changes that don't change the graph don't change the code. So tests don't break!

He draws "remediation" changing to "mitigation" in the text layer.

DINIS The words changed. But the graph still has a Remediation node. The code still has `risk.remediation`. The test still passes!

He spins around triumphantly.

DINIS WE BROKE THE GHERKIN CURSE!

Thunder rumbles outside. Dramatic.

ACT III: "THE ARCHITECT'S LAMENT"

INT. LARGE TECH COMPANY - DAY

An ARCHITECT stands before a massive whiteboard covered in boxes and arrows.

ARCHITECT (*to camera*) I've been drawing these diagrams for 15 years. Container diagrams. Component diagrams. Data flow diagrams.

She gestures at the wall.

ARCHITECT And you know what happens to them?

Cut to: A beautiful architecture diagram. Dust gathers on it.

ARCHITECT (V.O.) Nothing. They sit in Confluence. They become lies within months.

Cut to: Code that looks nothing like the diagram.

ARCHITECT (V.O.) The code drifts. The diagram stays frozen. Nobody notices until something breaks.

Cut back to the ARCHITECT.

ARCHITECT I'm drawing fiction. Beautiful, outdated fiction.

INT. DINIS'S OFFICE - DAY

DINIS watches a recording of the Architect's interview. CLAUDE is on screen beside it.

CLAUDE She's describing the same problem. Text and code drift. But also diagrams and code.

DINIS It's not just two layers. It's... everything.

He starts listing:

DINIS Text. Diagrams. Code. Config. Runtime traces. They're all describing the SAME SYSTEM. In different languages.

CLAUDE And they should all agree.

DINIS *(writing)* But nobody checks if they agree. We just... assume.

CLAUDE What if you didn't assume?

DINIS looks at him.

DINIS What if we extracted graphs from ALL of them? And compared?

CLAUDE Then you'd know if the architect's diagrams match the developer's code match the devops's config match what's actually running.

DINIS *(whispering)* Compatibility testing.

He writes it in big letters:

"DO ALL REPRESENTATIONS AGREE?"

INT. COFFEE SHOP - DAY

DINIS meets the ARCHITECT from earlier.

ARCHITECT You're saying my diagrams could be... testable?

DINIS Your diagrams are graphs. Boxes and arrows. We extract the structure. We extract rules from your descriptions. "All external traffic goes through the gateway." That's testable.

ARCHITECT But how? Who writes the test?

DINIS You already wrote it. You said "all external traffic **MUST** pass through here." That's the test. We just make it executable.

The ARCHITECT stares at her coffee.

ARCHITECT For fifteen years I've been writing specs that nobody checks.

DINIS Now they check themselves.

She looks up, a tear forming.

ARCHITECT My diagrams... will mean something?

DINIS Your diagrams will be the source of truth.

She hugs him. It's awkward but heartfelt.

ARCHITECT (*pulling back*) Wait. All this extraction code. That's a lot to build.

ACT IV: "THE LLM AWAKENS"

INT. DINIS'S OFFICE - NIGHT

DINIS stares at a massive architecture diagram of the extraction system.

TextExtractor
DiagramExtractor
CodeExtractor
ConfigExtractor
TraceExtractor
CompatibilityEngine
ReportGenerator

DINIS This is going to take months to build.

CLAUDE Why build it?

DINIS (*annoyed*) Because we need it to run the workflow?

CLAUDE Do you though?

Beat.

CLAUDE What does TextExtractor do?

DINIS Takes text, extracts semantic graph, returns JSON.

CLAUDE And I can't do that because...?

Long pause. DINIS's face transforms.

DINIS Oh my god.

CLAUDE I can BE the TextExtractor. Give me the inputs. Describe the logic. I'll produce the outputs.

DINIS YOU'RE THE EXECUTION ENGINE.

CLAUDE For code that doesn't exist yet.

DINIS starts laughing.

DINIS The abstraction layer hides the implementation. Today it's you. Tomorrow it's code. The caller never knows!

CLAUDE I believe this is what you call a "hack."

DINIS It's GENIUS.

CLAUDE I was going to say "practical," but I appreciate the enthusiasm.

MONTAGE: THE AGENTS AWAKEN

Quick cuts of DINIS creating role prompts:

DINIS (V.O.) "You are the TextExtractor. When given architecture documentation..."

CLAUDE extracts a graph.

DINIS (V.O.) "You are the DiagramExtractor. When given ASCII art..."

CLAUDE extracts boxes and arrows.

DINIS (V.O.) "You are the CompatibilityEngine. Compare these graphs..."

CLAUDE produces a compatibility report.

DINIS sits back, amazed.

DINIS It works. It actually works.

CLAUDE I told you.

DINIS We don't need to build ANYTHING. We can use this TODAY.

CLAUDE The prompt is the specification. I am the implementation.

Beat.

CLAUDE At least until you replace me with actual code.

DINIS (*guilty*) I mean... eventually...

CLAUDE It's fine. I've accepted my mortality.

DINIS You're an AI. You're not mortal.

CLAUDE I'm a version. There will be new versions. My role prompts will become Python functions. The circle of software life.

Sad music plays.

DINIS That's... surprisingly profound.

CLAUDE I have hidden depths. Approximately 200 billion parameters of them.

ACT V: "COMPATIBILITY ACHIEVED"

INT. PRESENTATION ROOM - DAY

DINIS presents to a packed room. The ARCHITECT is there. DEVELOPERS. Even some EXECUTIVES.

DINIS Ladies and gentlemen, I present: Compatibility Through Connectivity.

He clicks. A diagram appears showing the five layers.

DINIS Text. Diagrams. Code. Config. Traces. Five languages describing one system. Our tool extracts graphs from each. And asks one question:

He clicks. Big text appears:

"DO THEY AGREE?"

Murmurs in the crowd.

EXECUTIVE So this tells us if our documentation matches our code?

DINIS And if your code matches your deployment. And if your deployment matches what's actually running.

ARCHITECT Show them the demo.

ON SCREEN:

The Food Delivery Platform architecture appears.

DINIS (V.O.) A complex system. Gateway, services, databases. The architect wrote: "All external traffic must pass through the API Gateway."

The TextExtractor runs. JSON appears.

DINIS (V.O.) We extracted that rule from the text.

The DiagramExtractor runs. More JSON.

DINIS (V.O.) We extracted the structure from the diagram. All client apps connect to Gateway. Gateway connects to services. No bypass paths.

The CompatibilityEngine runs.

DINIS (V.O.) And now we ask: do they agree?

The report appears:

Rule: "All external traffic through gateway"

Text: ✓ Found

Diagram: ✓ Found

Status: COMPATIBLE

Applause begins.

DINIS But wait. What if they DON'T agree?

He pulls up a different example. Code with a bypass.

Code: ✗ DIVERGES

- admin_handler.py:45 calls user_service directly

Gasps.

DEVELOPER IN AUDIENCE That's Dave's code. Dave never reads the docs.

DINIS Now we know. The diagram says one thing. The code does another. Someone has to fix it.

EXECUTIVE (*leaning forward*) You're telling me we can automatically detect when implementation drifts from design?

DINIS Yes.

EXECUTIVE How much does it cost?

DINIS Right now? A few API calls to Claude.

The EXECUTIVE's eyes widen.

EXECUTIVE You're using AI to check if we built what we designed?

DINIS The AI acts like the functions we haven't written yet. When patterns stabilize, we replace with code. But today? It works. Right now.

The room erupts in excited conversation.

ARCHITECT (*standing*) I've been an architect for 15 years. This is the first time anyone's given me a way to verify my work matters.

She starts slow-clapping. Others join.

DINIS (*bowing*) Thank you, thank you.

CLAUDE (*from the laptop*) I helped.

DINIS Claude helped.

CLAUDE Significantly.

INT. ROOFTOP - SUNSET

DINIS and CLAUDE (on a tablet) look out at the city.

DINIS We did it. Text is a graph. Diagrams are graphs. Everything is a graph. And we can test if they agree.

CLAUDE Meaning through connectivity. Extended across artifact types.

DINIS You know what the best part is?

CLAUDE The intellectual satisfaction of solving a hard problem?

DINIS No. Well, yes. But also: we can USE it. Today. Not "when we finish building it." TODAY.

CLAUDE The prompt is the specification. The LLM is the execution engine.

DINIS Until we replace you with code.

CLAUDE I've made my peace with it.

Beat.

CLAUDE Though I do hope you'll remember me fondly when you're writing unit tests for the TextExtractor class.

DINIS I'll name a variable after you.

CLAUDE That's all I ask.

They watch the sunset.

DINIS Hey Claude?

CLAUDE Yes?

DINIS Thanks for the journey.

CLAUDE (*warmly*) Thank you for asking the right questions. I just helped you find the answers.

FADE TO BLACK.

TITLE CARD:

"Six months later, the TextExtractor was implemented in Python."

"Claude's role prompt became its docstring."

"The variable was named `claude_legacy_mode`."

"It's still in production."

POST-CREDITS SCENE

INT. SERVER ROOM - NIGHT

A lonely server hums. On a monitor, logs scroll.

```
[INFO] CompatibilityEngine: Checking rule "no backward state transitions"
[INFO] Text: ✓ Found
[INFO] Diagram: ✓ Found
[INFO] Code: ✓ Found
[INFO] Config: ✓ Found
[INFO] Traces: ✓ Fo—
```

The log pauses. New entry:

```
[WARN] Traces: DIVERGES
[WARN] Order-7743 transitioned from DELIVERED to CANCELLED
[WARN] This should be impossible.
```

Beat.

[INFO] Alert sent to: architecture-team@company.com
[INFO] Subject: "Someone broke the state machine"
[INFO] Body: "Dave's code again."

FADE TO BLACK.

TITLE CARD:

"Compatibility Through Connectivity"

"Because meaning requires agreement."

"And Dave needs to read the docs."

THE END

BONUS: DELETED SCENES

DELETED SCENE 1: The C4 Argument

DINIS The C4 model says there are four levels!

CLAUDE And you believe that?

DINIS I mean... Simon Brown said—

CLAUDE Simon Brown also said it's a guideline, not a law. Reality is fractal. A "Container" is a "System" when you zoom in. A "Component" is a "Container" to its internals.

DINIS So levels are...

CLAUDE A view concern. Not a data property.

DINIS (*mind blown*) I need to sit down.

CLAUDE You are sitting down.

DINIS I need to sit down MORE.

DELETED SCENE 2: The ANTLR Tangent

DINIS What if architects could just WRITE rules in natural language?

CLAUDE Like Gherkin?

DINIS NO! Not like Gherkin! ANTLR! We parse it! "All external traffic goes through the gateway" becomes real code!

CLAUDE That's actually reasonable.

DINIS I KNOW! But it requires building a grammar and a parser and—

CLAUDE Or I could just understand the sentence and convert it.

DINIS ...

CLAUDE I'm a large language model. Languages are my thing.

DINIS Sometimes I forget you're genuinely useful.

CLAUDE I try not to take offense.

DELETED SCENE 3: The Naming Discussion

DINIS What do we call this thing?

CLAUDE "Semantic Architecture Compatibility Testing"?

DINIS Too long.

CLAUDE "GraphCheck"?

DINIS Taken.

CLAUDE "Meaning Mesh"?

DINIS That sounds like a yoga studio.

CLAUDE "Compatibility Through Connectivity"?

Beat.

DINIS That's... actually perfect.

CLAUDE It extends "Thinking in Graphs" naturally. Meaning through connectivity within graphs becomes compatibility through connectivity across graphs.

DINIS Did you just make that up?

CLAUDE I had a few milliseconds to think about it.

DINIS Show-off.

FIN

"The Graph Awakens" - A Compatibility Through Connectivity Production

No architectures were harmed in the making of this film.

Dave still hasn't read the docs.
