

Secure Send: The Post-MVP Vision

Roadmap to Radical Transparency & Universal Deployment

Version 1.0 DRAFT | February 2026

The Core Shift: From SaaS to Platform

We are extending Secure Send from a single hosted SaaS into a deploy-anywhere, self-hostable platform.

The Philosophy: Radical Transparency

- + Show users everything we know about them.
- + Store everything explicitly.
- + Track exactly what each operation costs.

Key Capabilities

Built-in billing | Security intelligence | Browser fingerprint transparency | Bot detection

Strategic Priorities & Logic

Ubiquity Strategy: Deploy Anywhere

Secure Send should be deployable by **anyone, in minutes**. The hosted SaaS (**send.example.com**) is just one instance of a universal package.

Architectural Freedom

- `pip install` = Works on local filesystem.
- `docker run` = Defaults to local fs, switches to S3 via env vars.
- `Lambda` = Uses S3 via M-Graph config.

Radical Cost Transparency

The Problem: You cannot price what you cannot measure.

The Solution: Micro-Accounting. Every request, file transfer, and S3 operation carries a tracked cost.

The Goal: Answer the question, 'How much did it cost me to serve that 50MB file?' down to the fraction of a penny.

The Cost Model breakdown

$$\text{Total Transfer Cost} = \text{Upload} + \frac{\text{Storage}}{\text{Duration}} + \overset{N}{\text{Downloads}}$$

Compute

- Lambda invocation (Duration × Memory)
- API Gateway requests

Storage

- S3 PUT (upload)
- S3 Storage (GB/month pro-rated)
- S3 GET (download)

Network

- S3 transfer out
- CloudFront (Request + GB transfer)

Summed in real-time per transaction.

The Business Model: Margins & Credits

Pricing Strategy: Users buy credit packs (£5, £10, £25)

Value Proposition: Convenience + Privacy > Raw Storage Costs

File Size	User Cost	Infra Cost	Margin
< 10MB	£0.10	~£0.00001	99.9%
10–50MB	£0.25	~£0.0001	99.6%
100–500MB	£1.00	~£0.05	95.0%

Browser Fingerprint Transparency

We show you because we believe you should know.

The Feature: A UI panel that displays everything the site detects about the user. It is not designed to be creepy, but educational.

Differentiator through honesty.

The Data We See

Passive Signals (Server-Side)

- IP Address & Geolocation (e.g., London, UK)
- ISP / ASN & Threat Score
- VPN/Proxy detection

Active Signals (Client JS)

- **Hardware:** Screen resolution, Battery status, Device memory, CPU cores
- **Identity:** Canvas fingerprint (hash), WebGL renderer, Installed fonts
- **Context:** Timezone, Language, Network connection type

Security Intelligence (IDS)

Vision: A lightweight intrusion detection system that surfaces threats to both the operator and the user.

Artifact: Per-request enrichment stored in `events.json``

Bot & Abuse Detection

Taxonomy of Traffic

Human

- Variable timing
- Mouse/Touch events
- Unique canvas
- **Response: Full Access**

Bot

- Uniform timing
- Missing renderers
- Known-bad User Agents
- **Response: CAPTCHA / Hard Block**

Agentic AI

- Burst patterns
- Headless browsers
- Automation flags
- **Response: Rate Limit / Flag**

Infrastructure Isolation

The Rule: Secure Send runs in a **Dedicated AWS Account**.

Blast Radius Containment:
Compromise cannot affect other services.

Clean Billing: 100% of costs in this account = Secure Send.

Compliance: GDPR data processing scope is strictly per-account.

Key Operational Metrics

Question:

Question: What does a single transfer cost exactly?

Source: cost.json

Question:

Question: Which tokens are costing the most?

Source: Aggregated Token Data

Question:

Question: What is the monthly infrastructure burn rate?

Source: AWS Cost Explorer

The Ultimate Metric:
Revenue vs. Cost Margin.
Is the pricing model sustainable?

The Future State

Secure Send evolves from a simple tool into a robust ecosystem.

1. **Universal Reach:** From local laptops to enterprise AWS clusters.
2. **Economic Clarity:** High margins driven by micro-precision accounting.
3. **Uncompromising Trust:** Radical transparency in data and security.

A self-hostable, transparent,
A self-hostable, transparent, secure, and profitable platform.
