

SG/Send

Private file sharing that works like you'd expect —except
nobody can read your files. Not even us.

Zero friction. Zero knowledge.

- **No Account.** Just a browser. No email required.

- **No App.** No installs. Works on Chrome, Firefox, Safari, Edge.

- **No Prying.** Encryption happens **before** upload.

The server stores **encrypted data it cannot read**. The decryption key stays with you.

Who holds the keys?

The Industry Standard (Dropbox/Google)

They encrypt it, but they hold the keys.
Vulnerable to breach and subpoena.

SG/Send

Mathematically incapable of reading
your file.

Most services encrypt data 'at rest' but retain the ability to decrypt it.
With SG/Send, the server never sees the key.

Browser-based Encryption.

Algorithm: AES-256-GCM

Implementation: Web Crypto API (Standard, auditable)

No proprietary 'black box' cryptography

Two channels, one transfer.

send.sgraph.ai/download • #DecryptionKey123

Link (Public)

Key (Secret Fragment)

Email

Signal/WhatsApp

For maximum security, split the delivery.
Even if the email is intercepted, the file remains locked.

| We tell you exactly what we captured.

What We Stored (The Log)

- ✓ • Hash of IP address (not the actual IP)
- ✓ • Upload timestamp
- ✓ • File size
- ✓ • Encryption method

What We Never Stored (The Void)

- ✗ • Original IP address
- ✗ • File name
- ✗ • File content
- ✗ • The Decryption Key

Heavy Lifting: Up to 1GB.

Parallel Uploads:
Split into chunks,
uploaded 5-at-a-time.

Speed: A 42MB file
takes ~15-20 seconds.

Integrity: Automatic
checks upon download.

| Don't paste secrets into Slack.

```
1: API_KEY = sk-[REDACTED]  
2: PASSWORD = *****(REDACTED)*****  
3: |
```

Problem:

Slack and Email store your text in plaintext, searchable by admins.

Solution:

Switch to Text Mode. Paste keys or notes. Encrypt instantly. The server never sees the plaintext.

Your personal encrypted vault.

- Not just for transfers. Use SG/Send as a private file manager.
- Upload, browse, preview, and edit.
- Concept: You hold the only key; the server stores a locked box it cannot open.

When privacy actually matters.

Sensitive Docs

Tax returns, medical records, HR files.

DevOps Secrets

Sharing SSH keys/config without chat logs.

External Partners

Clients without enterprise accounts.

Shadow IT Replacement

Audit-friendly alternative to WeTransfer.

| A tool, not an ecosystem.

Feature	SG/Send	WeTransfer	Tresorit
Zero-Knowledge Encryption	YES	NO	YES
Open Source	YES	NO	NO
Recipient Account Needed?	NO	NO	YES
Self-Hostable	YES	NO	NO

We aren't trying to replace your productivity suite. We are the courier for your secrets.

I Honest Limitations.

NOT Dropbox: No folder syncing or real-time collaboration.

NOT Infinite: 1GB limit. Not for 50GB video files.

NOT Anonymous: We store an IP hash and timestamp to prevent abuse.

NOT Certified (Yet): No SOC 2 or HIPAA certificates. Use at your own risk or self-host.

Built by AI. Contains NO AI.

The Workshop (Agents)

```
function processFile(file) {  
  // Standard, auditable encryption  
  const encrypted = encrypt(file, key);  
  return encrypted;  
}  
  
const result = processFile(inputFile);  
console.log(result); // ALWAYS the same output
```

The Product (Deterministic)

The Paradox: Built by 18 AI Agents, but the production code is 100% deterministic.

Result: No AI processes your files. No AI 'hallucinates' your encryption. Just standard, auditable code.

The 19-Member Team (1 Human).

- Development guided by [Wardley Mapping](#).
- Agents write, review, and test the code.
- Verification: [297](#) passing tests. Code is public on Git.

Try it now.

Encrypt & Upload

send.sgraph.ai

- 1. Drop a file.
- 2. Click Encrypt.
- 3. Share the link.

The file is encrypted. We can't read it. Nobody can, except whoever has the link.
