

Receiver Environment Analysis

Architecture Brief v0.6.14 | Client-Side Security Posture

Date: 23 Feb 2026 | From: Human (Project Lead)

The Zero-Knowledge Paradox

- **Constraint:** Server is Zero-Knowledge by design. No IP logging. No location tracking.
- **Problem:** The Server cannot judge if a receiver is safe because it cannot 'see' them.
- **Blind Spot:** Malicious actors exploit this anonymity.

"Zero-knowledge by design shouldn't mean zero-trust verification."

Server-Side

The Courier

- Zero Knowledge
- Cannot see IP or browser details
- Cannot make trust decisions

Client-Side

The Investigator

- Full Knowledge
- Sees IP, location, network, hardware
- CAN make trust decisions

We move the analysis to where the data lives: the Receiver's browser.

The Digital Fingerprint: Raw Data Collection

Enrichment: Contextual Intelligence

The Posture Score

The Secure Pipeline: Encryption Flow

The Server never sees the analysis. It only transports the sealed envelope.

The Receiver Experience: Transparency & Consent

If declined, sender is notified and can choose to abort.

Sender Dashboard: Safe Scenario

Sender Dashboard: Risk Scenario

Defense in Depth: Anti-Gaming

Integration with Dual Authorization

Two-Step Secure Delivery:
The system informs, the human decides.

Technical Requirements

Implementation Specs

- ☐ Client-side collection (JS) implemented
- ☐ Report generated as JSON & PKE Encrypted
- ☐ Sender Dashboard visualization built
- ☐ Transparency UI (Consent/Decline logic) active
- ☐ Anti-gaming logic (IP cross-reference) documented

Summary: The Illuminated Blind Spot

Server stays
Zero-Knowledge

Sender gets
Full Context

Receiver keeps
Control

Security is smarter,
not just harder
