

SGraph Send: The AI-Sender Evolution

v0.6.32 Milestone Report – The First Zero-Knowledge AI Delivery

Date: 26 Feb 2026

Role: Cartographer

Status: Proven

Version: v0.6.32

Evolution Achieved: AI Can Now Send Secrets

The Old World: Browser-Only Tool

The New World: Programmable Ecosystem

Core Message: On 26 Feb 2026, we proved that an AI agent can generate, encrypt, and deliver a document without the server ever seeing the content, filename, or key. SGraph Send is now Sender-Agnostic.

The Architecture Held Firm

Scaling to AI senders did not compromise the Zero-Knowledge promise.

The Proven Pipeline (v0.6.32)

Every arrow represents a proven, tested connection executed on 26 Feb.

Bridging the Gap: MCP & The 'Data' Parameter

The Constraint: Browser upload methods (multipart forms) were unreliable for AI agents.

The Fix: Added the 'data' parameter to the upload route.

Technical Note: Allows AI clients to pass file content directly without encoding complexity.

Evidence: Proven working with Claude.ai.

SGMETA: Protecting Metadata in Transit

The Problem: Keeping filenames secret but usable without a human typing them.

The Solution: An encrypted 'envelope' wrapping the file and metadata together.

Validation: Filename survived the full round-trip (Encrypt -> Upload -> Download -> Decrypt).

The Sherpa Agent: From Concept to Prototype

Evolution: Concept → Early Custom-Built

PDF Generator Module
(Status: Active)

Orchestration Logic
(Status: Manual / Human-in-the-loop)

Encryption Engine
(Status: Active)

Sherpa Agent (v1)

The Win: First successful AI-to-Human document delivery.

The Constraint: Currently requires manual orchestration. The agent needs step-by-step prompts to encrypt, upload, and send. It is functional, but not yet fully autonomous.

The New Delivery Vector: Email via n8n

Evolution: Genesis
(First Execution)

The Security Trade-off: Unlike browser links, email delivery passes the key through AWS WorkMail. The key is encrypted in transit but visible to the email provider (AWS). The SGraph Server remains blind.

Mapping the Movement

Cyan = Trusted (Moving/Evolving)
 Amber = WIP (Stationary)
 Red = Untrusted (Stationary Commodity)

Validating the Evolution

Component	Before State	After State (v0.6.32)
MCP Route	 Untested	 Proven with 2 client types (Browser & AI)
SGMETA	 Code Only	 Production Round-trip Verified
n8n Email	 Non-existent	 Single successful fire
data Parameter	 Did not exist	 Born at Custom-Built

"When a component works across multiple client types, it moves beyond experiment to pattern."

Unlocking New Product Categories

Infrastructure for Secure AI Agents

Automated
Financial Reporting

Secure CI/CD
Data Exports

AI-Assisted
Legal Workflows

Strategic Insight: SGraph Send is no longer just 'Dropbox for Paranoiacs.' It is zero-knowledge delivery, accessible to both humans and machines.

Maturing the Pipeline: Road to Product

Construction Checklist

Missing Links for Product Rating

MCP Route

Needs error handling, rate limiting, status endpoints.

Sherpa Agent

Needs single-instruction autonomy ('Send X to Y').

SGMETA

Needs formal specification & multi-file support.

Email

Needs templating, bounce handling, retry logic.

Estimated Effort: 4-6 Sessions to Maturity.

Next Priorities

Cartographer's Orders

AppSec

Review the email trust model. Key visibility in WorkMail.

Architect

Formalise the dual-mode API. Browser vs. MCP/data param.

Explorer

Run additional AI-sender experiments.

New document types beyond PDF.

Dev

Implement retry logic in the n8n workflow.

Evolution Status: v0.6.32 Verified

Summary: We have successfully opened a second integration surface (MCP) without breaking the security model. The Zero-Knowledge architecture is sender-agnostic.
