

Validating the Stack: The "Wikipedia for Careers" Use Case

Aligning SG/Send Architecture
with Real-World Social Impact

INTERNAL BRIEFING | STATUS:
CONCEPT ALIGNMENT | 26 FEB 2026

FROM ABSTRACT FEATURES TO CONCRETE IMPACT

The Wikipedia for Careers is not our product. It is our perfect stress test.

THE PROJECT

A separate initiative to map social mobility and career paths.

THE RELATIONSHIP

A human-centred use case to validate our roadmap.

THE GOAL

Identify intersections where SG/Send tech (Data Rooms, MCP, PKI) solves real-world friction.

Abstract features become concrete when you can say: "This is what it would unlock." This document identifies where our current build solves their problems, and where specific gaps remain.

Intersection 01: Securing Sensitive Narratives

THE PROBLEM

Raw interview transcripts contain sensitive personal history and career struggles. They cannot exist in public repos or shared docs.

SG/SEND SOLUTION

Symmetric-key data rooms. Server-blind storage. Access control granted to specific agents and revoked when processing is complete.

EFFORT: LOW (Wiring Existing Capabilities)

STATUS: NEEDS ENGINEERING

Intersection 02: Cryptographic Verifiability

THE PROBLEM

Readers must verify claims (e.g., '70% of CISOs pivoted'). Documents are prone to editing, backdating, or selective disclosure. Trust is the currency.

SG/SEND SOLUTION

PKI signing infrastructure. Every document signed by a creator key. Issues-FS for dependency tracking.

EFFORT: MEDIUM (Primitives Exist)

STATUS: NEEDS DESIGN

Intersection 03: Signed, Labelled Translation

THE PROBLEM

Traditional workflows break provenance. The link between a Portuguese audio original and an English text output is often lost or unverifiable.

SG/SEND SOLUTION

Versioned, linked files within the data room.
Explicit parent-child linking structure.

EFFORT: LOW-MEDIUM

STATUS: NEEDS DEFINITION

Intersection 04: Decentralised Knowledge Base

THE PROBLEM

The public reference site needs to be permanent, open, and independent of any single company's goodwill.

SG/SEND SOLUTION

Static site architecture (S3 + CloudFront, Jekyll-based) currently used for sgraph.ai. Deployable from public GitHub.

EFFORT: VERY LOW

STATUS: SOLVED / EXTRACTION ONLY

Intersection 05: Inverting the Credit Pyramid

THE PROBLEM

Open source obscures small contributors. We need to credit interviewers, translators, and analysts equally—not just the repo owner.

SG/SEND SOLUTION

Issues-FS tracks dependencies. PKI attributes every action to a key.

The Contribution Graph

EFFORT: MEDIUM-HIGH

STATUS: STRATEGIC OPPORTUNITY

A Platform for Trusted Knowledge

ISO CROSS-SECTION

This architecture proves SG/Send is not just a Dropbox clone; it is an agent-assisted knowledge infrastructure.

Why This Matters to SG/Send

Real Needs

Moves us from hypothetical features to immediate requirements.

Values Alignment

Social mobility is a cause worth powering. Aligns with our ethical stance.

Zero Lock-In

Creative Commons (CC BY 4.0) aligns with our "no proprietary components" principle.

Open Source Synergy

We solve our own infra problems while enabling an open ecosystem.

Immediate Next Steps

Action Table

WHO	WHAT	WHEN
Human / Ambassador	Identify 3-5 pilot interview subjects	This week
Architect / AppSec	Design provenance structure & map needs to v0.7.1	Next sprint
DevOps / Dev	Extract static site template	Next sprint
Architect	Draft contribution graph design	Sprint +2

A Catalyst for Meaningful Tech

Abstract features become concrete when you can say:
'This is what it would unlock.'
