

SGraph Send Goes Live

Early Access, Documentation,
and the Architecture of
Zero-Knowledge.

13 FEBRUARY 2026 • MILESTONE RELEASE

send.sgraph.ai

From MVP to Production in a Single Session.

SGraph Send is live. The documentation is deployed. The waitlist is open. This marks the first time real users can share zero-knowledge encrypted files through the production system.

Yesterday, the system was a working MVP with persistent storage but limited to the development team. Today, it is a public-facing product with authentication, analytics, and transparent documentation.

SYSTEM STATUS

-  Application: Live
[send.sgraph.ai]
-  Documentation: Live
[docs.send.sgraph.ai]
-  Waitlist: Open

The Transformation

YESTERDAY / INTERNAL MVP

- Global API Key middleware
- JSON "Not Found" errors on root
- No user analytics
- Undocumented

TODAY / PUBLIC BETA

- Surgical, per-route Access Token auth
- Public-facing Web Component Access Gate
- Root domain redirect to App
- Unified Google Analytics (App + Docs)
- Jekyll-based Documentation site

Feature Deep Dive: The Access Gate

Zero dependencies, pure functionality.

The Component

Wraps the upload interface.
Replaces raw 401 errors with a UI.

The Mechanism

Checks localStorage.
Listens for invalid token events dynamically.

The Token

A single environment variable
(`SGRAPH_SEND__ACCESS_TOKEN`).
Entered once, stored forever.

Feature Deep Dive: The Growth Engine

“Every file recipient is a **potential sender**.”

INTEGRATION: LaunchList forms embedded in application flow.

PLACEMENT: Immediately below the download component. The highest-intent capture point.

Authentication Strategy: The Sender

Surgical protection for state-changing operations.

Mechanism: Per-route access token check.

The Logic: The access token is a rate-limiting and abuse-prevention mechanism. It controls WHO can create transfers during the beta period.

Authentication Strategy: The Recipient

Zero barriers to decryption.

Mechanism: No login required. No token required.

The Logic: The decryption key IS the authentication. The server is a blind storage container. Barriers to entry add friction, not security.

Philosophy: Friction vs. Security

“This is not a missing feature. This is the design.”

- ❑ **Zero-Knowledge means Zero Barriers:** Forcing accounts degrades utility.
- ❑ **The Security Boundary:** Resides in the encryption, not the HTTP request.
- ❑ **Trust Model:** The server does not need to know who you are to serve data it cannot read.

The Ecosystem

Documentation: Includes 'How It Works', 'Transparency', and 'Blog'.

Unified Analytics: Single property tracks the full user journey from reading the docs to sending a file.

By The Numbers

Protected vs Public Routes

Infrastructure Sprint Delivered

S3 persistence, CI/CD, access control, analytics, and documentation. Each piece makes the next possible. The product is no longer theoretical—it has a URL.

Next Steps

- 1. Try the App:**
`send.sgraph.ai`  
- 2. Read the Docs:**
`docs.send.sgraph.ai`  
- 3. Join the Waitlist:**
Sign up via Access Gate
or Download page
