

MVP Launch & First Feedback

Moving from ‘It Works’
to ‘It Flows’

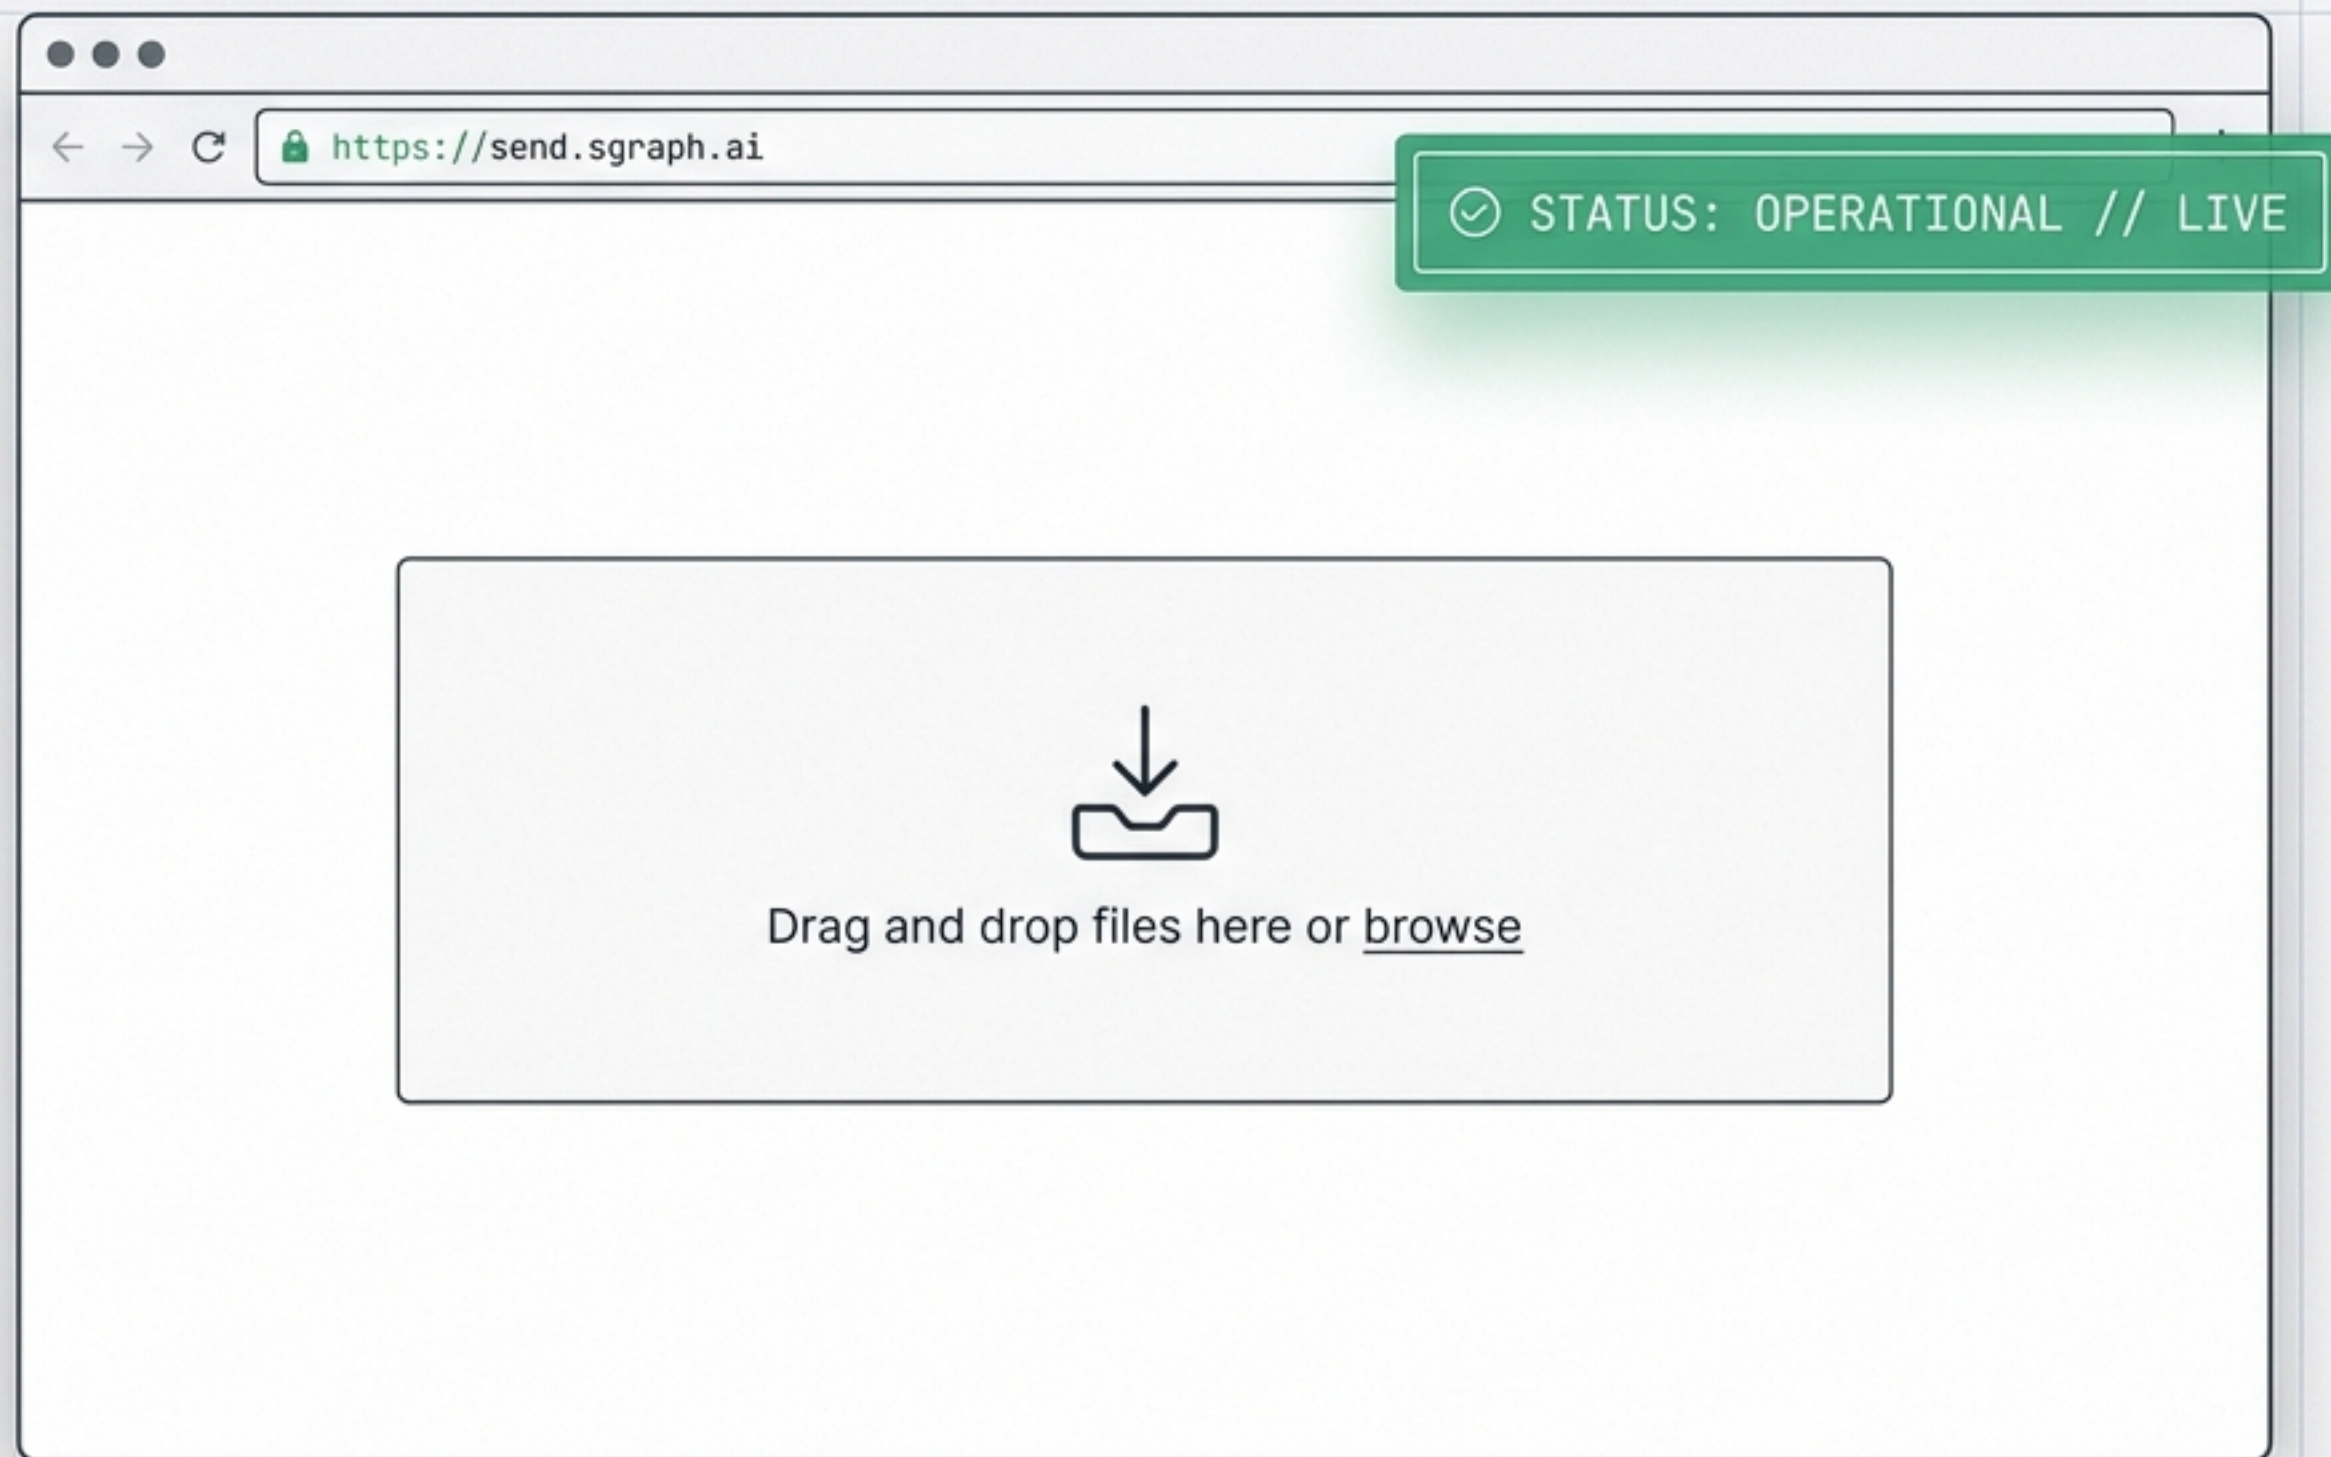

DATE :: 13 FEB 2026
VERSION :: v0.2.16
STATUS :: MVP LIVE

FROM :: HUMAN (PROJECT LEAD)
TO :: ALL ROLES VIA CONDUCTOR

SYSTEM OPERATIONAL

“We had our first actual user user use the product — and I was watching.”

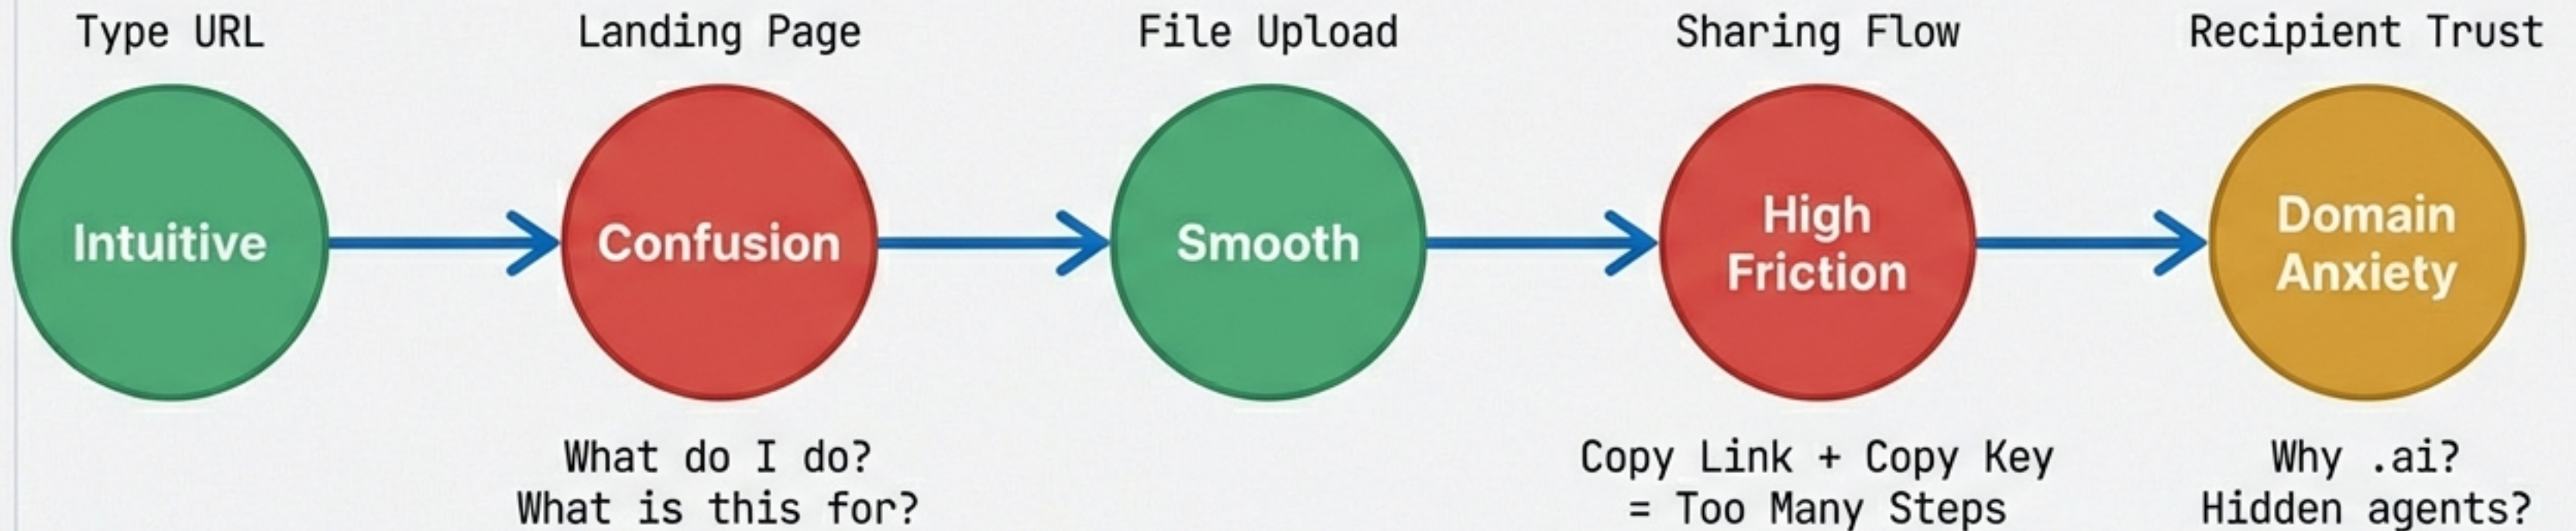

The domain is live. The waiting list is enabled. The flow is happening.

First User Feedback: The Reality Check

Overall impression: Positive ('This is cool') but friction detected.

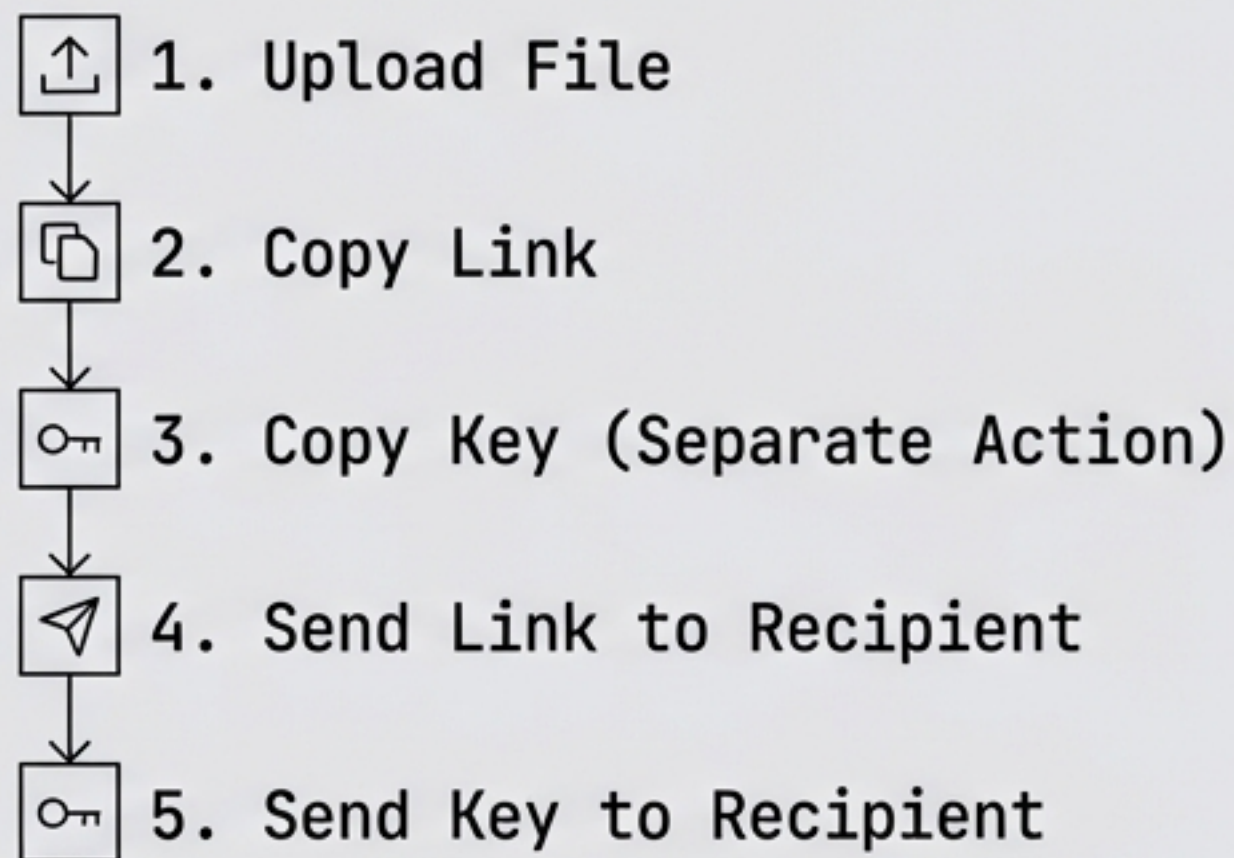

Friction Map

“The headline is: send a file. Securely. Simply.”

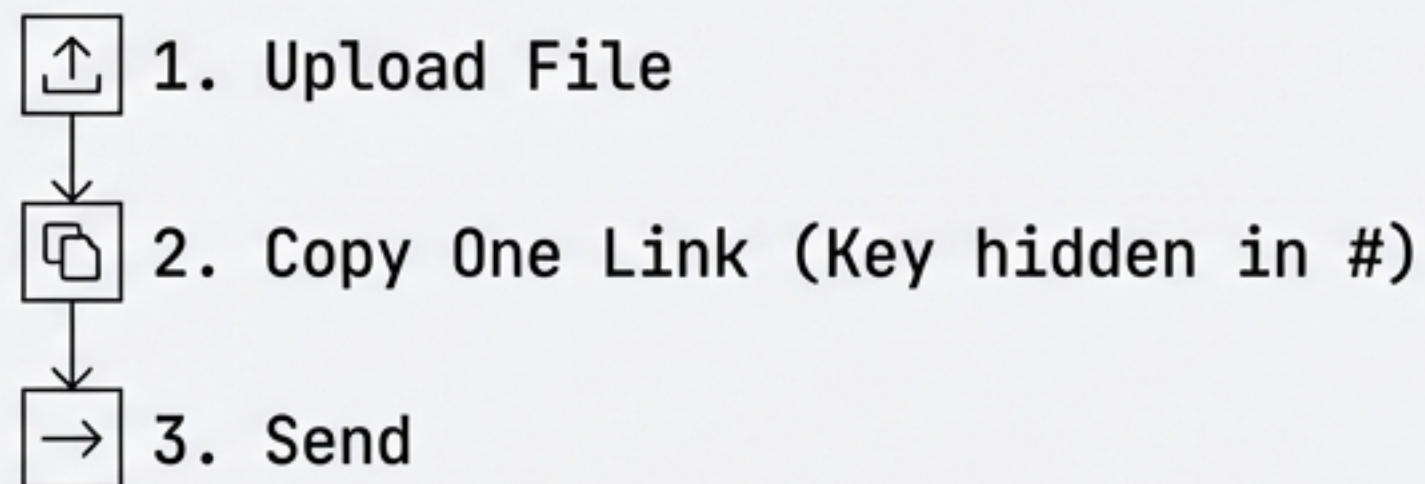

Priority UX Change: The Hash Fragment Strategy

CURRENT STATE (FRICTION)

❗ *Multiple points of failure.*

FUTURE STATE (FLOW)

✅ *Single action. Zero friction.*

ARCHITECT VERIFICATION: The hash fragment (#) never leaves the client. It is NOT sent to the server. Zero-knowledge promise is maintained.

Simplifying the Interface & Increasing Utility

ACTION 1: TEXT INPUT

- ✓ Enable sending "Hello World", passwords, or notes without creating a dummy file. Allows users to test the flow instantly.

ACTION 2: EXPLAINER CONTENT

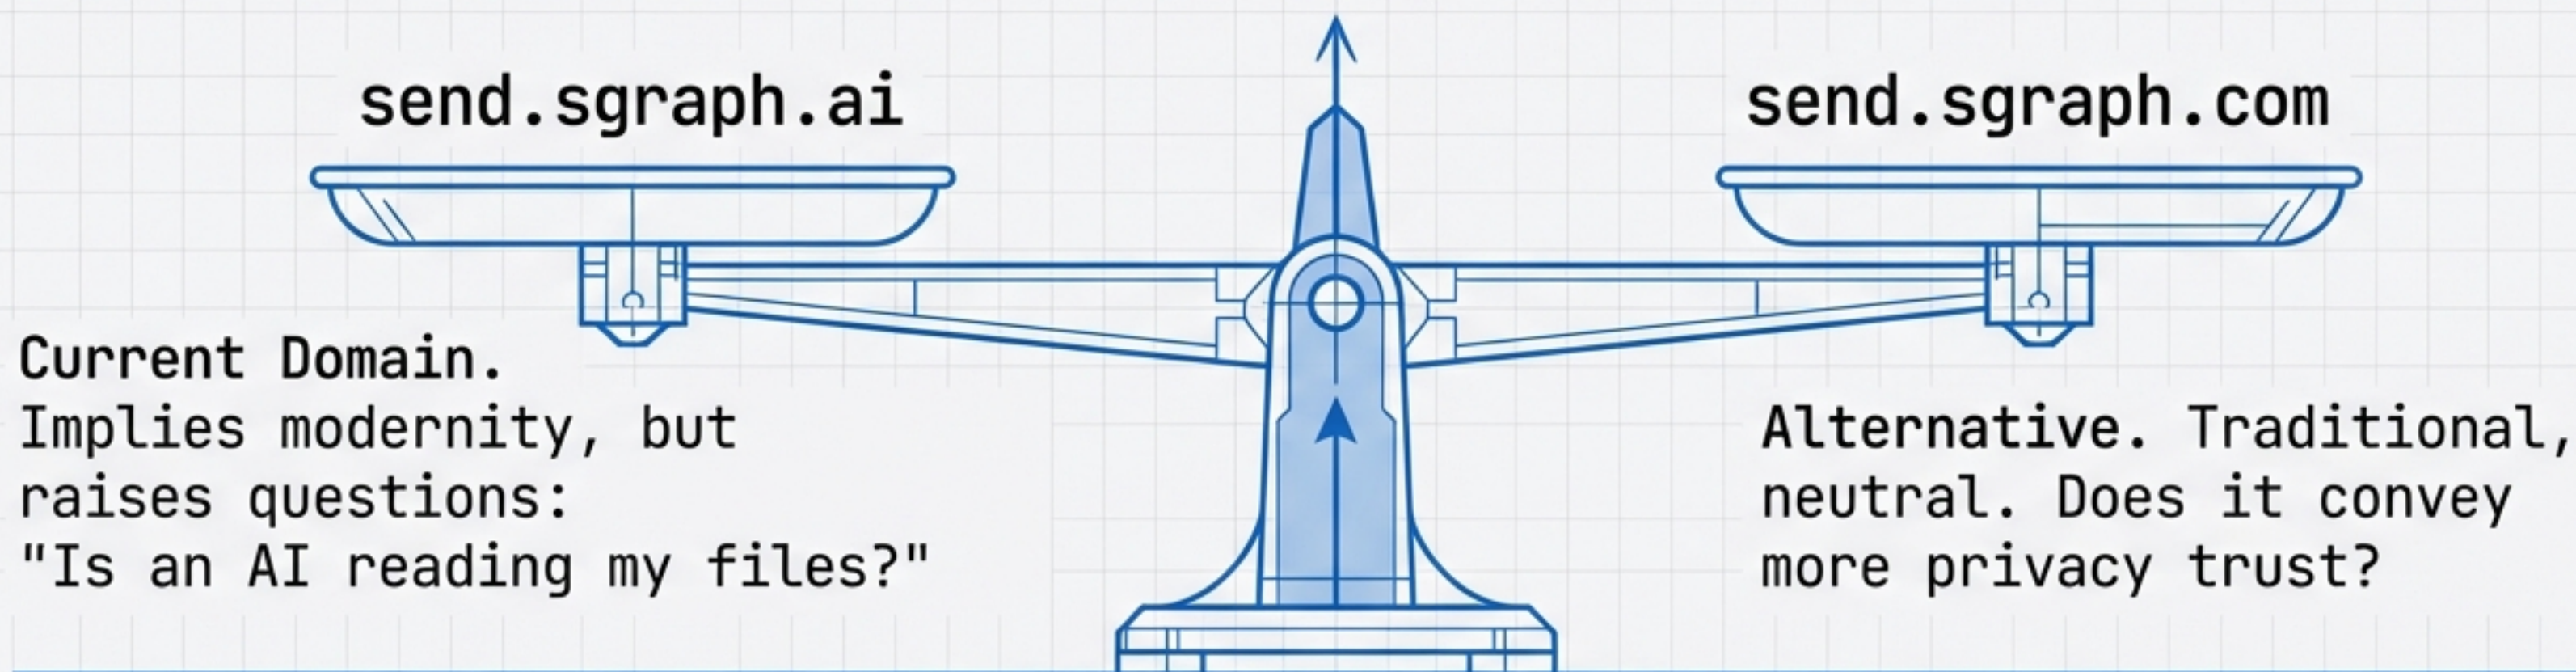

- i Answer "What is this?" in 10 seconds. Don't lead with security. Lead with utility: Send a file.

ACTION 3: DRAG-AND-DROP FIX

- ✓ Make the download link draggable directly into email or chat windows.

The Trust Question: Positioning Strategy

RESEARCH TASK (ADVOCATE + SHERPA)

- Does .ai create confusion about the product's function?
- Is there a fear of agentic interference in a zero-knowledge tool?
- Objective: Determine which TLD yields higher trust for a privacy product.

Admin Capabilities: Managing the Waiting List

Admin Panel

CREATE

Batch Size

10

Generate Batch Tokens

VISUALISE

Token ID	Status (Active/Used)	Timestamp
TOKEN123	Active	2024-10-27T10:00:00Z
TOKEN456	Used	2024-10-26T14:30:00Z
TOKEN789	Active	2024-10-27T10:05:00Z

Generated Link Output

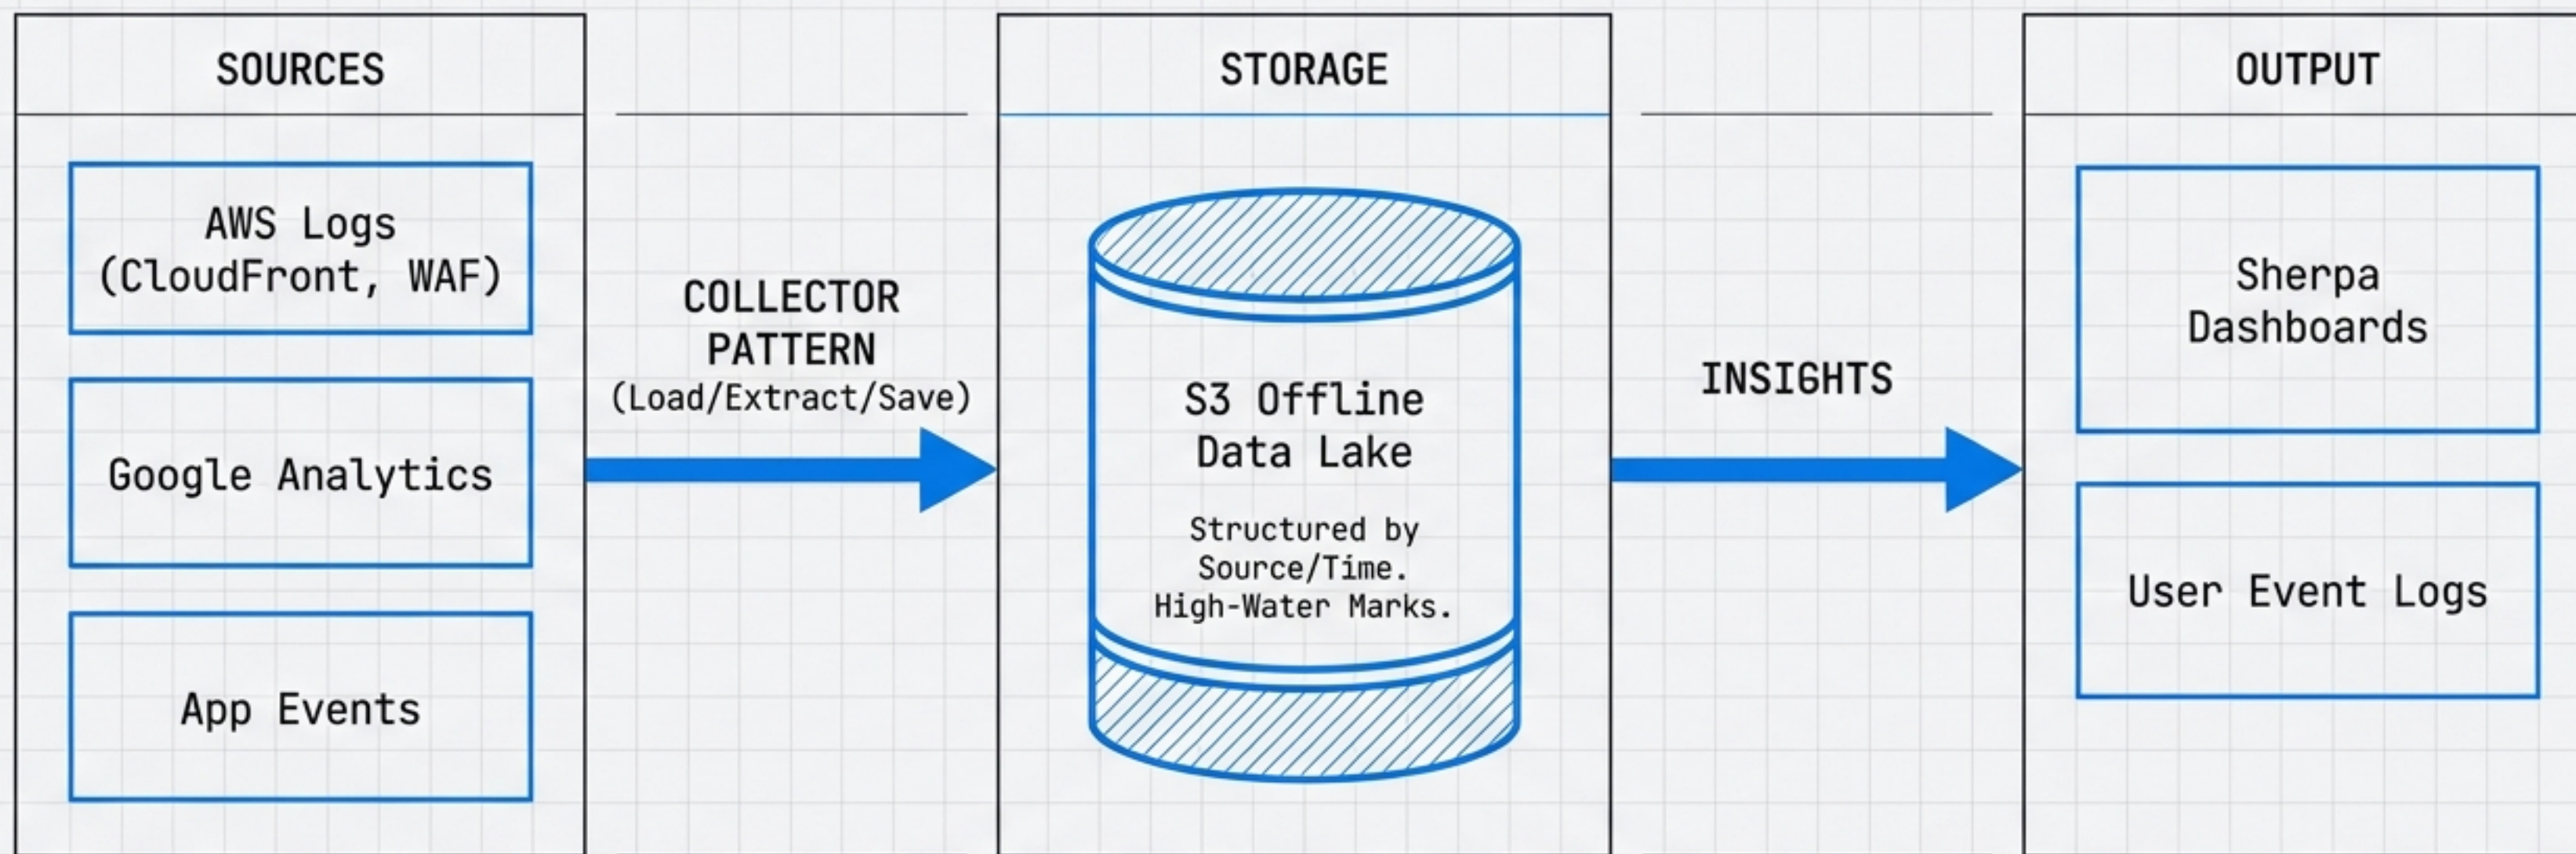

<https://send.sgraph.ai/?invite=TOKEN123>

Note: Token is in the URL path (Server-side tracking), not the hash.

SHERPA NOTE

This is a key onboarding moment. We must track the trail from invitation to activation.

Observability: The Data Lake Strategy

DEVOPS ACTION: Brief required on all available AWS logging settings.

User-Facing Transparency (Event Data)

Concept:

Turn observability into a trust feature. Expose the 'Trail' to the user so they know the fate of their data.

Roles:

Dev + Designer + DPO
(Privacy Check).

File Activity Log

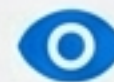

10:00 AM - File Created

10:05 AM - File Viewed (1x)

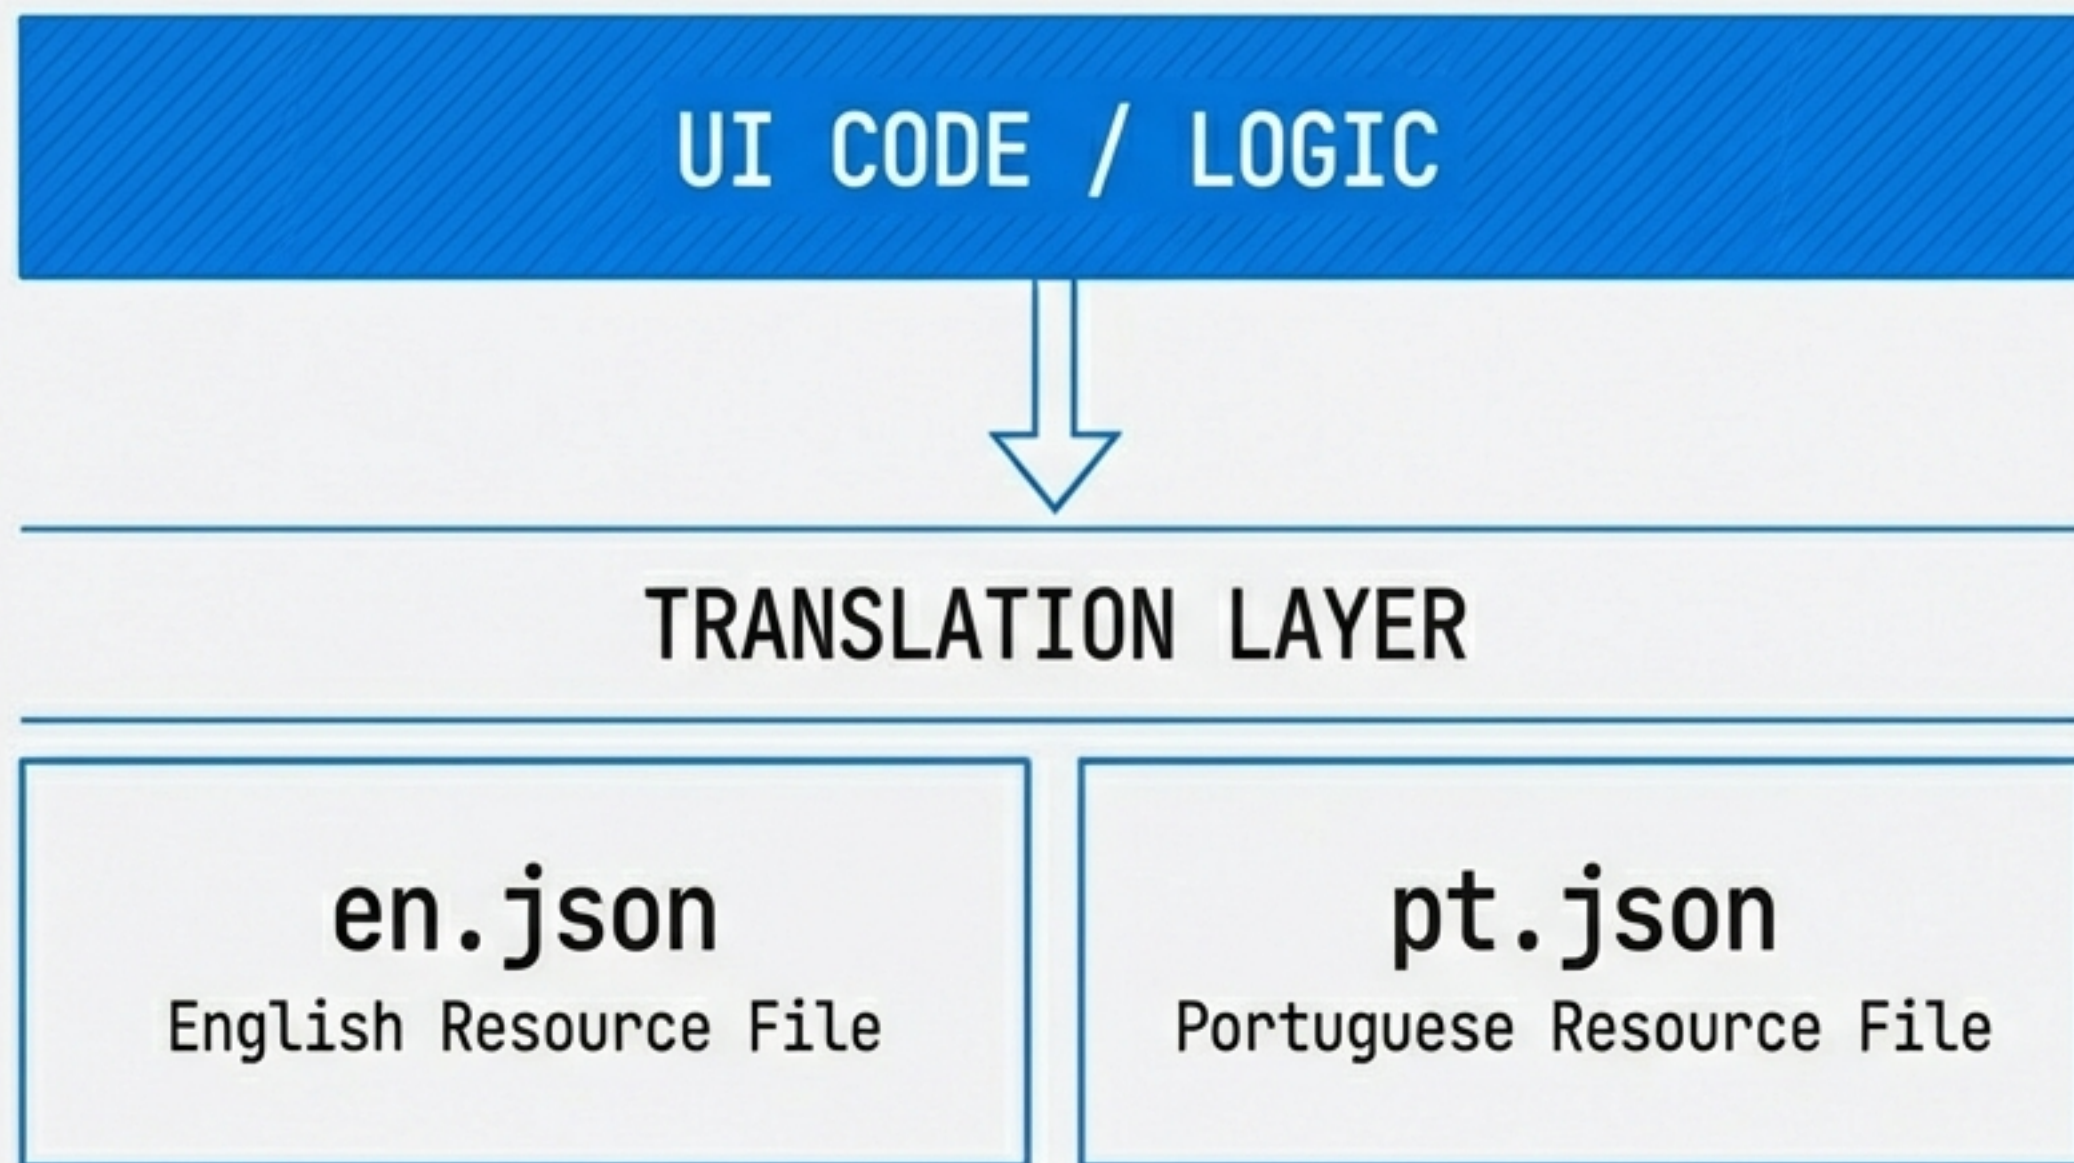

10:06 AM - File Downloaded

10:06 AM - File Viewed (2x)

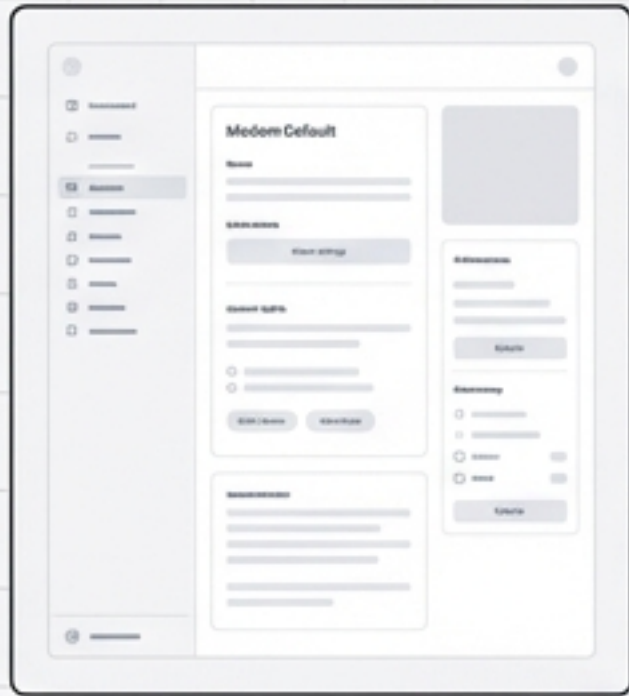

Architecture: Internationalisation (i18n)

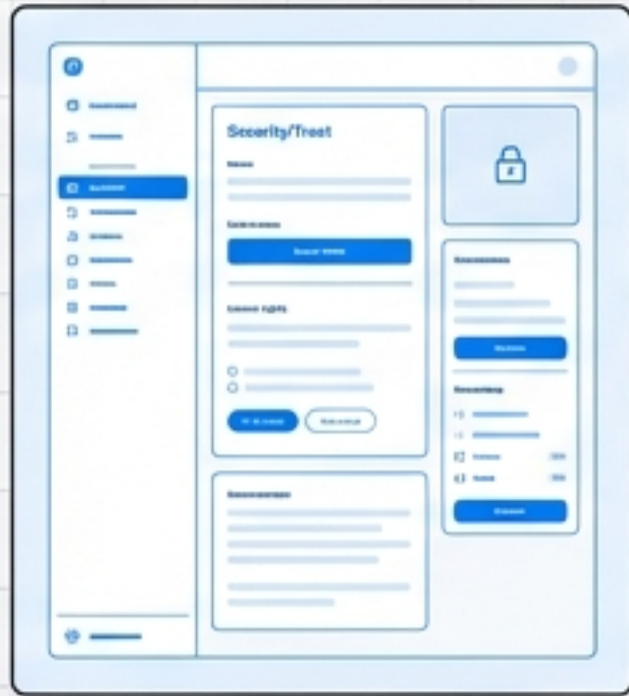

Workflow Note:

- Journalist authors copy directly into translation system.
- Synthetic users (user_friendly_en, user_friendly_pt) validate flows.

Architecture: The Five Themes

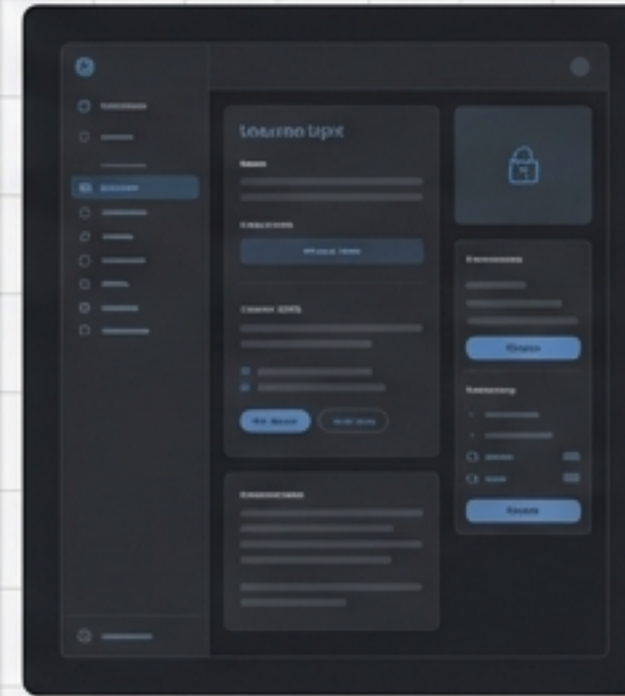

AURORA
(Modern Default)

GLACIER
(Security/Trust)

EMBER
(Approachable)

DARK MODE
(Low Light)

HIGH CONTRAST
(Accessibility)

Technical Spec:

CSS-variable-based system for instant switching.

Growth & Sharing Mechanisms

Viral Loop Touchpoint

Copy as Text

Open in Gmail

Copies pre-formatted message (Link + Explanation + Instructions) to clipboard.

Pre-populates a Compose window with the template.

Copy Strategy: The email template is the First Impression. It must be written by the Journalist to ensure clarity.

Summary & Task Matrix

PRIORITY 1 (CRITICAL PATH)		Owner
Hash-in-URL Implementation		AppSec/Dev
Text Input Feature		Dev/Des
DevOps Brief		DevOps
PRIORITY 2 (IMPORTANT)		
Explainer Content		
Admin Tokens		
Data Lake Setup		
i18n Architecture		
Themes		
Sharing Options		
PRIORITY 3 (BACKGROUND)		
Domain Research		
DPO Review		
GA Integration		

Gating Item: The hash-in-URL review determines the speed of the UX track. Let's have an exciting day.
