

The Agentic Briefing Workflow

From Voice Memo to Parallel Execution: A Symmetrical System for Human-AI Collaboration

The Challenge of Agentic Oversight

The Friction:

In agentic teamwork, the fundamental problem is maintaining human direction without becoming the bottleneck.

The Risk:

Losing track of outputs across multiple threads and failing to leverage parallel processing.

The Question:

How do we direct a team of 15+ agents simultaneously while keeping the Source of Truth intact?

A Symmetrical System of Flow

Phase 1: Capture via High-Bandwidth Audio

The Input:

Deliberately unstructured
stream-of-consciousness.

The Math of Efficiency:

A 12-minute voice memo $\approx$ **3,000 words**.
Writing this takes hours; speaking it takes minutes.

Key Insight:

Do not aim for polish. Aim for **raw information capture**. The process filters noise later.

Tooling:

Transcription via **Otter.ai**.

Phase 2: Refine and Translate

Context Awareness:

The thread knows project roles, architecture, and history.

The Task:

Extract signal from noise.
Organise sections. Assign roles.

Surgical Edits:

Human reviews draft for tone and missing details.

A **polished brief** that **sounds like the human leader**, produced in **15–20 minutes**.

Phase 3: Committing to the Record

The Immutable Record:

The brief is saved as a Markdown file and committed to the GitHub development branch.

Why It Matters:

It is no longer a scrolling chat message. It has a version number and a commit hash.

Access:

Permanent project history, accessible to both humans and agents.

Phase 4: The One-Sentence Trigger

The diagram shows a terminal window with a black border and a light gray background. Inside the window, the text "> Please read this brief and act on it." is displayed in a monospaced font, followed by a solid black cursor block. The window is surrounded by a glowing orange border. Four dashed orange lines with crosshair targets at their ends extend from the corners of the window: one from the top-left pointing right, one from the top-right pointing left, one from the bottom-left pointing up, and one from the bottom-right pointing down. A solid black arrow points from the left towards the top-left corner of the window.

> Please read this brief and act on it.█

The Orchestrator: The **Master Agent (Claude Code Web)** takes control.

Analysis: Reads the brief to identify implicated roles, priorities, and dependencies.

Mechanism: Spawns sub-agents for each specific role defined in the brief.

Phase 4: Parallel Multi-Perspective Execution

Differentiation: Work happens in parallel, not sequentially. Issues surface **NOW**, not weeks later.

Phase 5: Consolidating the Debrief

- **The Problem:** Agent outputs are scattered across role folders.
- **The Solution:** The Master Agent compiles a single Debrief document.
- **Components:** Relative links to all work produced, high-level summary, reading order.
- **Directionality:** Bottom-up (Team → Human).

The Human Review Experience

Iterate

Record next
voice memo.

**Curated Consumption: The human consumes
a digest, not a raw feed of data.**

Architecture of Institutional Memory

```
Root
├── team
│   ├── humans
│   │   └── [name]
│   │       ├── briefs <-- "The Ask"
│   │       └── debriefs <-- "The Result"
│   └── roles
│       ├── architect
│       ├── ciso
│       └── journalist
└── REAME.md
```

- **Findability:** The structure enables the symmetrical workflow.
- **Archive:** A browsable, historical archive of the project's evolution.
- **Superiority:** Contains actual work products, not just meeting minutes.

The Multiplier Effect: Speed & Voice

Asymmetry of Effort

15–20 minutes of human time triggers hours of multi-agent work. Cycle times are measured in minutes, not days.

Preservation of Voice

Claude translates; it does not invent. The brief retains the human's logic, tangential insights, and specific style.

Traceability & Control

Audit Trail: Every decision, brief, and response is versioned in the Repo with a commit hash.

Non-Interference: The human directs and decides but does not coordinate. The Master Agent handles logistics.

The Cycle as a Flywheel

Evolution: Role definitions get richer. Claude understands the architecture better.

Momentum: It is a flywheel of continuous improvement. The more cycles you run, the better the outputs become.

The Operational Blueprint

1. Voice is the **Input**
(High Bandwidth).

2. Git is the **Memory**
(Permanent Record).

3. Agents are the **Workforce**
(Parallel Scale).

4. Symmetry is the **Logic** (Brief Down,
Debrief Up).

***The human's time is spent on high-value thinking;
the system handles the execution.***
