

SGraph Send: Daily Briefing

v0.2.32 | From MVP to Production

14 February 2026

Status: End-to-End Flow Complete

We Have a Full End-to-End Flow

With the latest push, the loop is closed. This is not a mock-up. The token system, backend architecture, and encryption logic are fully functional. We have a genuine MVP.

The Positioning Crisis: “Why Not WeTransfer?”

The User View

Perception: Just another file sender. The utility is clear, but the differentiation is invisible.

The Technical Reality

Reality: Zero-knowledge, browser-side encryption. Architecture is the product.

Strategic Directive:

- **Advocate:** Answer the comparison in the first 10 seconds.
- **Ambassador:** Define the one-line differentiator.
- **Designer:** Landing page must visually scream ‘Secure’ vs ‘Standard’.

The Opportunity is in the “Big File” Sweet Spot

Technical Requirements to Win:

- Retry capability
- Checksum verification (integrity check)
- Chunked/multipart uploads
- S3 backing = No theoretical size limit

Strategic Decision: The Unencrypted Mode

Encrypted Mode

SGraph Standard

Zero-knowledge.
Secure key handling.

Unencrypted Mode

Utility Mode

Direct S3 streaming.
Max speed. No privacy.

The Verdict: Default is always secure to protect the brand. Unencrypted is an explicit opt-out for massive, non-sensitive files. It solves the 'Get 5GB from A to B' friction without architectural changes.

Operational Pivot: Adopting Wardley Maps Structure

Core Concept: To ship a stable release, we cannot keep adding features to the same branch we are trying to harden. We are splitting operations into two distinct modes.

Team Definition: The Explorer

- **Mandate:** "Try this, build that, break things."
- **Focus:** Discovery, Features, Minor Versions, Experimentation.
- **Current State:** All current roles (Dev, Architect, etc.) have been operating here.
- **Output:** Alpha versions and Proof of Concepts.

Core Concept: To facilitate rapid innovation and market exploration through iterative experimentation.

Team Definition: The Villager

Mandate: Make it reliable. Make it deployable.

The Rules:

[X] NO new features.

[X] NO bug fixing (send back to Explorers).

[V] YES to hardening, scalability, and performance.

Output: The IFD (Iterative Flow Development) Release.

Core Concept: To facilitate stability, and reestablish equivalent living and compliance foundations and reliability.

Design Workstream: The Agency Brief

THEME SUPPORT

Aurora

Glacier

Ember

Action: Designer & Architect to create the brief and kickoff deck. We need a flexible design system, not a single static page.

Operations: Contextual Bot Access for Partners

Concept: Reduce human bottlenecks. External partners can ask "What is the hex code for the high-contrast theme?" and get an instant, context-aware answer.

Task: Architect to research integration.

Core Concept: To provide secure, on-demand, context-specific project information to partners via integrated bot interfaces.

Process Update: Immediate Adoption of Issues FS

```
// active_workstream.issues

Task-001 | Done      | MVP End-to-End Flow Validation
Task-002 | Pending   | Design Agency Brief Creation
Task-003 | Active    | Production Hardening (Villager Track)
```

Instruction: The barrier to entry is gone. We are moving to flat-file tracking.

➔ **Directive:** Conductor to create .issues files for all workstreams. All roles must update status here.

Roadmap Additions: Beyond the MVP

Current Sprint

✓ Read Receipts

Leverage event data to confirm download.

📁 Multi-File / Folder Management

Critical for Design Agency use case.

➔ **Owners:** Architect & Sherpa (Validating via trail data).

The Task Matrix: Priorities

Priority	Task	Owner
P1	Prepare IFD Production Release	Conductor/Dev
P1	Design Agency Brief & Kickoff	Designer
P1	Start using Issues FS (.issues)	All Roles
P2	Large file tech architecture	Architect
P2	'Why not WeTransfer?' messaging	Ambassador
P3	Unencrypted mode evaluation	AppSec

The Conductor's Directive

TRACK 1: VILLAGER

Prepare IFD Release. Stabilize. Ship.

TRACK 2: EXPLORER

Design Brief. Landing Page. Observability. Build.

➔ **Key Takeaway:** Mentally separate “adding features” from “preparing release”. Today we start shipping.

The MVP works. Now let's ship it.
