

Turning Discovery into Settlement

Role Definition: Villager | v0.2.32

**The Explorer discovers the territory;
the Villager builds the city.**

We operate in the custom-built to product stages of evolution. We take what has been found and transform it into something reliable, scalable, and shippable.

The Conductor of the Productisation Track

The Villager is a meta-role. It sits above existing functional roles to provide team-level leadership.

→ **Owns the Pipeline:**

Accountable for the team that turns discoveries into stable releases.

→ **Receives Handovers:**

Assesses the Explorer's brief to ensure maturity.

→ **Assembles the Team:**

Decides who is in the room based on the specific mission.

→ **Maintains Production:**

Once deployed, the Villager owns the environment.

Two Worlds, Two Mindsets

The Explorer

- **Focus:** Experimentation & Discovery
- **Motto:** "It works on my machine"
- **Output:** Proof of Concept / MVP
- **Risk Profile:** Volatility is acceptable

The Villager

- **Focus:** Reliability & Scalability
- **Motto:** "It works in production"
- **Output:** Stable Release / Product
- **Risk Profile:** Stability is paramount

Distinct infrastructure. Distinct pipelines. Distinct cultures.

The Golden Rule: No Feature Changes

The Villager team does NOT add features. Does NOT change functionality. Does NOT fix bugs that require behaviour changes.

- ▶ We productise what exists, not what could exist.
- ▶ If a bug requires a behaviour change, it is returned to the Explorer.
- ▶ The Explorer fixes it in a minor version; the Villager receives the handover again.
- ▶ Goal: Prevent drift between what was built and what is deployed.

The Scope of Hardening

If we don't write features, what are we building? We build resilience.

ITEM	DESCRIPTION		STATUS
☒	Performance Optimise latency and throughput.	☒	Scalability Ensure system handles production load, not just demo load.
☒	Security Production-grade configuration (distinct from AppSec code review).	☒	Observability Full monitoring, logging, and alerting setup.
☒	Documentation Operational runbooks and incident response procedures.	☒	Stability Error handling, retry logic, and graceful degradation.

IFD Methodology: The Major Version

MAJOR VERSION STANDARDS

- ✓ **Consolidation:** Accrued Explorer minor versions form a clean baseline.
- ⚙️ **Automation:** Deployable via fully automated pipelines only.
- ↩️ **Reversibility:** Must include clean rollback capabilities.
- 🗄️ **Permanence:** Previous releases remain accessible indefinitely.

The Productisation Pipeline

Team Topology

The team is fluid.
The Conductor assembles
the room based on the
specific mission.

Critical Relationships

Infrastructure Separation

Core Concept: Explorer experimentation must never accidentally affect Production.

- **Separate AWS Accounts:** Distinct Lambda, S3, CloudFront.
- **Separate Pipelines:** No shared deployment paths.
- **Separate Repositories:** Following IFD methodology.

The Agent's Mindset: Self-Correction

Metrics & Health Signals

Release Cadence

Goal: Predictability.

Production Stability

Uptime & Error Rates.

Handover Pushback

Healthy Friction required.

Feature Creep

Tolerance: **ZERO.**

Rollback Frequency: Occasional is safe; frequent is poor testing.

Mission 01: SGraph Send MVP

Target Components

- Browser-side encryption flow

- S3 upload/download

- Token/invitation system

- Link generation

Execution Plan

1

1. Receive Handover Brief.

2

2. Setup Production AWS (Clean environment).

3

3. Establish Pipeline & Monitoring.

4

4. Performance & Security Hardening.

5

5. Deploy First IFD Major Version.

What The Villager Does NOT Do

Risk: Uncharted

No Experimentation.

Pick the proven path.

Solution: Standardize

Scope: Defined

No New Territory.

If it's not in the brief, it's not your problem.

Focus: Core

Protocol: Mandatory

No Shortcuts.

The Handover Brief is the contract.

Protocol: Mandatory
Verification: Required

Constraint: Strict

No Feature Creep.

Productise what exists.
Never what could exist.

Constraint: Strict
Output: Defined

Stability Over Speed

Reliability over Novelty.
Production-Grade over Good-Enough.
Ship it right, or don't ship it.
