

SGraph Send: Design Strategy Update

Synthesis of Cruz & Cruz Kickoff
Feedback & Strategic Direction

The Strategic Synthesis

The Key Win

- Pivoting trust signals from Spatial (dashboard) to Temporal (wait times). We utilise the upload time for education.

The Refinement

-  Elimination of developer jargon ('Blob') to align with end-user mental models.

The Expansion

-  Initiating cultural colour research to support global privacy markets.

The Verdict

-  Green light to proceed with design, incorporating the 'Progress Moments' framework.

The Tension Between Simplicity and Trust

The Challenge: SGraph Send offers robust security features (client-side encryption, ephemeral keys). We initially felt the need to prove this via a dense “Trust Dashboard”.

Initial Approach (Spatial)

The Critique

Do we need to show all of this at the same time?

Reframing Trust: From Spatial to Temporal

Turning 'Dead Time' into education.

The Insight: The upload process creates natural wait states. Instead of fighting for screen screen real estate, we deliver the right message at the exact moment the user is paying attention.

The Narrative Progress Bar

Encrypting locally in your browser...

Your key stays with you. We never see it.

Stored: Encrypted Data, File Size, Timestamp. That's it.

Progress Moments

Future-Proofing: The Corporate Extension

The Vision: In B2B contexts, the 'wait space' becomes a pluggable slot for the client. Security teams can insert policy reminders, and compliance can add handling instructions.

Pluggable Content Slot

Internal Use Only - Level 4 Security

Uploading and Encrypting...

Architecture must support dynamic injection of client-side messaging.

Colour is Not Universal

The Strategy: We cannot rely on a single 'Trust' palette. Privacy and danger signals differ globally. We must prioritise research for privacy-aware markets.

Action: Identify top 3 privacy markets for colour semiotics analysis.

Turning Design Decisions into Content

Concept: Don't just show a theme; explain it. The Theme Picker links to a rationale page to drive engagement.

Impact: Creates a viral, organic feedback loop.

Vocabulary Hygiene

Eliminating Developer-Speak

~~BLOB~~

ENCRYPTED FILE

The Fix: If it requires a CS degree to understand, it doesn't belong in the UI. Replace "Blob" with "Encrypted File" or "Secure Data".

Decisions on Scope and Naming

PARKED (No Action)

Topic: The word 'Graph' in SGraph.

Feedback: Too technical.

Decision: Retain name. It connects to future semantic graph capabilities.

NOTED (Creative Signal)

Topic: The word 'Savvy'.

Feedback: Agency liked the persona term.

Decision: Adopt for Tone of Voice and marketing, but not for product naming.

Action Matrix

CRITICAL	Implement 'Progress Moments' design (Temporal Trust)	UX
HIGH	Remove 'Blob' terminology from UI	Copy
MEDIUM	Research cultural colour meanings	Research
FUTURE	Architecture for corporate messaging slots	Dev

The Path Forward

- 1 Designer Role:** Update brief with 'Progress Moments' requirement.
- 2 Dev Team:** Investigate pluggable content architecture.
- 3 Cruz & Cruz:** Proceed with design using SGraph Send name.
- 4 Research:** Identify top 3 privacy markets.

SGraph Send

Secure. Simple. Savvy.
